ABSTRACT

CORRELATION BETWEEN NURSE’S OBJECTIVE WORKLOAD BASED ON TIME AND MOTION STUDY (TMS) AND QUALITY OF NURSING DOCUMENTATION IN RSU HAJI SURABAYA

By: Mira Melynda Prakosa

Introduction. The quality of documentation can decrease because of bad admission filling of documentation. Workload is one of the factor that can influence admission filling of documentation. This study was aimed to analyze the correlation between nurse’s objective workload and the quality of nursing documentation in RSU Haji. Method. The design of this study was descriptive correlation with cross-sectional approach. The population on this study were the nurses that works in Marwah 3 and 4 inpatient care in RSU Haji Surabaya. The number of the sample was 14 respondents were selected by simple random sampling. The independent variable was nurse’s objective workload and the dependent variable was quality of nursing documentation. The data were analyzed by using logistic regression. Result. Nurse’s objective workload in RSU Haji was 72%. There was no corelational between nurse’s objective workload with the completeness of nursing documentation (p= 0.999), also nurse’s objective workload with accuracy of nursing documentation (p= 0.999). Discussion. This study concluded that nurse’s objective workload was low and quality of nursing documentation was accurate enough and complete enough. Further researcher should provide precise operational so the factors that affected the quality of documentation can be reached and the workload of the nurses in RSU Haji become ideal.
