   Alfi Asben, and Deivy Andhika Permata*.  Download PDF

34. Effect of different doses of melanin in the blood protein changes in rats under alkaline esophageal burns.
   Chornenka NM*, Raetska Ya. B, Savchuk OM, Kompanets IV, Beregova TV, Ostapchenko LI.  Download PDF

35. Development of the technology of combined meat product using biomass from the spleen of horses
   Sholpan Baytukanova, Mukhtarbek Kakimov, Saule Baytukanova, Kairat Bekbayev, Zhayik Tokhtarov*, and Aidyn Igenbayev.  Download PDF

   Swaminathan S, Srinivasan A*, Ramasamy K and Narasimhan D.  Download PDF

37. Germination and Seedling Characteristics of Moringa Oleifera (Lam.) from Different Sites in Egypt.
   Shaltout KH, Ali HI, Ahmed Mobarak, BarakaDM, and Aly SH*.  Download PDF

38. Role of photonic crystals in Red Palm Weevil, Rhynchophorus ferrugineus Olivier coloration.
   Mohamed Ragaei, and Al-kazafy H Sabry*.  Download PDF

39. A Theoretical Study on the Vibrational and UV/VIS Spectra for the some 1, 3, 4-oxadiazole Derivatives by Using DFT Approach.
   Assan Faeez, and Shatha Fadil Al-Saidi*.  Download PDF

40. Fusion of CT-PET Lungs Tumour images using Dual Tree Complex Wavelet Transform.
   Naveenadevi R*, Nimhara S, and Ganesh Babu TR.  Download PDF

41. Machine Vision Based Automatic Segmentation and Yield Counting Of Fruits By Color And Shape Features
   Gayathri Devi T*, and Neelamegam P.  Download PDF

42. Telemedicine- A catalyst to health promotion.

43. The Potential Of Oviposition Of Paederus Fuscipes With The Treatment Ofcalotropsis procera Leaf Powder.
   Harpreet Singh, and Sudhakar Gupta*.  Download PDF

44. Study of the density of Rapeseed, Lio and Nigella oils before and after heating.

45. Influence of Processing and fermentation on chemical composition, total phenolic and phytic acid of some cereals and legumes
   Ibrahim M Hamed* and Mona M Hussein.  Download PDF

46. Assessment of Serum Malondialdehyde (MDA) and Urinary8-hydroxydeoxyguanosine (8-OHdG) in Egyptian Children with Type I Diabetes Mellitus and Factors affecting.
   Aber M Nour El Din Abd El Baky*, Nagwa Abdallah Ismail, Maha MA Abo-Hashesh, Manal E Kandil1, Inas A Rasheed, Eman H Thabet and Dalia El-Lebedy  Download PDF

47. Comparative evaluation of antimicrobial properties of three different extracts of Achyranthes asperaLinn and chlorhexidine against salivary microflora.
   Snehal V Shep*, Rahul R Deshpande, Vishwas Patil, Fawaz Siddiqui, Anjali Ruikar, and CDShendkar.  Download PDF

   Seethalakshmi R*, Vijayabanu C, Saavithri V, and Kannan K.  Download PDF

49. Comparison of the effects of topical corneal inhibitory agents on TTL and PON1 in rats.
   Adem Soydan, Hayrullah Yazar*, Ayhan Cetinkaya, Elcin Hakan Terzi, Fatih Ulus, and Umit Dogan.  Download PDF

50. Novel strategy for driving homogeneity principles in So A using Association Rule Mining Technique.
   Appas Ali M*, and Sugumar R.  Download PDF

   Eman Mwafy A*, Dawy M, Abouelsayed A, Elsabbagh I A, and Elfass M M.  Download PDF

52. Electrical resistivity of vegetable oils: olive, argan, nigella, prickly pear, palm, colza, linseed, almond and castor.
53. A Survey on the role of k-means Clustering Algorithm in Privacy Preserving Data Mining.

Keerthika K, Manikandan G*, Harish V, and Nooka Saikumar. [Download PDF]

54. Estimation of Bit Error Rate of an Optical OFDM System.

Swaminathan S*, and Raajan NR. [Download PDF]

55. Preparation, Characterization and In-vivo Evaluation of Span 60-Lornoxicam Niosomes.

Mohamed Shafik El-Ridy, Soad Aly Yehia, Amira Mohamed Mohsen*, Sally A. El-Awdan and Asmaa Badawy Darwish [Download PDF]

L Prabaharan*, M Muthukumaran, A Sivapathi, S Gopalakrishnan and A Raghunathan. [Download PDF]

57. A Comparative Study of the Effect of Training in the two Groups of Peers and Health care experts on Quality of Life among the adolescent girls living in rural areas of Qazvin, Iran.

Zahra Hosseinkhani, Hashem Alijani, Reza Pakzad, Iraj Pakzad, and Maryam Zamanian*. [Download PDF]

58. A Census of Ethnomedicinal Plants Used In Bankura District, West Bengal.

Sayani Biswas*, and Ambarish Mukherjee. [Download PDF]

59. Bioassay of tannin rich fraction and identification of compounds using UV-Vis, FTIR and RP-HPLC.

Rajeswari Anburaj* and Vinoth Jothiprakasam. [Download PDF]

60. Identification of Attacker and Tracking Mobile User Based On GPS Location in Disruption Tolerant Networks.

Raviteja S, Kavitha Esther Rajakumari, Prudhvi Krishna TR*. [Download PDF]

61. Effect of Aerobic Exercise Program on Immunosensencence in Young Elderly.

Nesreen Zahran*, Nagwa Badr, Bassant Hamdy, and Hoda Fahiem. [Download PDF]

62. GLAD-PCR assay of selected R(5mC)GY sites in URBI and CEPBD genes in human genome.

Alexandr G Akishev, Murat A Abdurashitov*, Viktoriya L Sitko, Nina A Netesova, Irina F Radaeva, Elena A Nechaeva, and Sergey Kh Degtyarev [Download PDF]

63. Synthesis of new quinoline derivatives from methylene Meldrum’s acid and screening the biological properties.

Hanan F Mohssen, Naji M Ali*, and Hanaa A Ali. [Download PDF]

64. Comparison of Sol-Gel And Hydrothermal Synthesis Of Zinc Ferrite (ZnFe204) Nanoparticles.

Syukri Arief*, Rahmayeni, and Zulhadri. [Download PDF]

65. Energy Audit: A Case Study on Buildings

C Venkatasubramanian*, and MK Divyaparakash. [Download PDF]

66. Rare Case of Cortical Nephrocalcinosis In Post Pulmonary Tuberculosis.

Neeharika Chintala*, Siddanth Ojha, Kanakaraj K, and Prabakaran M. [Download PDF]

Sai Sujana T*, and Madhu Sudan Rao N. [Download PDF]

68. A Literature Review of Website Quality of Pharmaceutical Companies.

P Vijay Shankar*, and ST Surulivel. [Download PDF]

69. The Impact of Fetuin-A Level on Patients with Acute Myocardial Infarction.

Haydar H Al-Shalah*, Oday Al-Salih, Dina Ayed Mohammed [Download PDF]

70. Prevalence of Nosocomial Infection at a Razi teaching Hospital, during 2010-2015.

Sahar Geravandi, Seyed Mohammad Alavi, Farkhondeh Jamshidi, Farid Yousefi, Sasan Moogahi, Niloofar Mohamadrezai Esfarjani, Ahmad Reza Yari, Mohammad Mahboubi, Masoud Torabpour, Sina Dobaradar, Saeed Shirali, and Mohammad Javad Mohammad* [Download PDF]

Yogapiya M*, and Kavitha T. [Download PDF]
Sathish S*, Ponduru Sai Akshay, and Shivam Mishra.  Download PDF

74. Personalized Context-Aware Mobile Recommendation System Based on Hybrid Filtering Approach.  
Sivaramakrishnan N*, Subramaniyaswamy V, Muralidharan K, Dharmarajan V, and Praveen Kumar G.  Download PDF

75. Synchronous Occurrence of Malignant Mixed Mullerian Tumor In the Uterus And Ovary: A Case Report.  
Chaitra C, Swati Sharma*, Manna Vaiathan, and Muralidhar V Pai.  Download PDF

76. A Survey on Internet of Things (IoT) Technologies, Architecture, Protocols, And Application.  
G Balamurugan*, and B Baranidharan.  Download PDF

Suganya SD*, Rajasekhar Reddy M, and Vaithiyathan V.  Download PDF

78. A Study on Various Techniques of Image Dehazing.  
Sasireka E*, Karthikeyan B, and Vaithiyathan V.  Download PDF

79. Integrated Control against Root Rot and Wilt Diseases of Cantaloupe under Plastic Houses Conditions  
Abdel-Kader MM*, El-Mougy NS, Shaheen AM, and Rizk FA.  Download PDF

80. Synthesis of New Silver Analgesic Drug.  
Omar B Ibrahim, Eman M Elsewedy, Mohamed Y El-Sayed, Abdel Majid A. Adam and Moamen S Refat*.  Download PDF

Omar B Ibrahim, Eman M Elsewedy, Mohamed Y El-Sayed, Abdel Majid A. Adam and Moamen S Refat*.  Download PDF

Moh'd Mamoun Al Majthoub, Eman M Elsewedy, Mohamed Y El-sayed, Abdel Majid A. Adam and Moamen S Refat*.  Download PDF

83. Synthesis of New Zirconium(IV) Paracetamol Drug.  
Moh'd Mamoun Al Majthoub, Eman M Elsewedy, Mohamed Y El-Sayed, Abdel Majid A. Adam and Moamen S Refat*.  Download PDF

84. Effects Of Sodium Carbonate Concentration And Temperature On The Yield And Quality Characteristics Of Alginate Extracted From Sargassum Sp.  
Syaharuddin Kasim*, Asnah Marzuki, and Sumarheni Sudir.  Download PDF

Christy A and Meera Gandhi G*.  Download PDF

86. Pattern Recognition Using PCA algorithms.  
G Uma Maheswari*, EP Ephzibah, and V Mareeswari.  Download PDF

87. Characterization and inhibition by natural agents of multidrug resistant bacteria isolated from wounds.  
Abdul-Raouf Al-Mohammadi*.  Download PDF

88. Antidepressant-Like Effect of Amaranth Oil Pre-Treatment In Experimental Myocardial Infarction.  
N Preobrazhenskaya*, T Berezhnova, V Zoloedov, and N Fateeva  Download PDF

89. A Survey on Different Floorplanning Techniques.  
Abinaya S* and Saravanan S.  Download PDF

90. Review on Various Classification of Cryptographic Attack and The Countermeasures.  
Elavarasi V*, and Saravanan S.  Download PDF
93. **A Review on Enhancing Cache Power Strategies.**  
   Jerline J*, and Vijay Sai R.  
   [Download PDF](#)

94. **A Survey on Reduction of Logic Operators in FIR Filter.**  
   Sathiya Priya S*, and Saravanan R.  
   [Download PDF](#)

95. **A survey on router in bufferless NoC.**  
   Sivaranjani U*,and Muralidharan D.  
   [Download PDF](#)

96. **A Survey on Low Power With High Performance Hybrid Full Adder.**  
   Thenmozhi V*, Dr Muthaiah R.  
   [Download PDF](#)

97. **A Survey Paper on Time-To-Digital Converter (TDC).**  
   Mahima R*, and Muralidharan D.  
   [Download PDF](#)

98. **Scan-chain free functional testing for secured hardware systems.**  
   Ananth Hari R*, and R Muthaiah.  
   [Download PDF](#)

99. **FIR filter design for 2-1 Sigma-Delta Modulator using Simulink Model.**  
   U Jagan Mohan*, and R Muthaiah.  
   [Download PDF](#)

100. **A Survey on Fruit Fly Optimization Algorithm and Its Improvements.**  
   K Kiruthigha*, and KS Ravichandran.  
   [Download PDF](#)

101. **Variation in the Levels of Steroidal Sapogenins within the Mature Fruit of Balanites aegyptiaca and among Kernels of Balanites Fruit Accessions Collected from Different Geographical Localities in Sudan.**  
   Nour A. Osman-Bashir, and Salah A.A. Elhussein*  
   [Download PDF](#)

102. **A Survey on Brain Tumor Segmentation.**  
   B Chitra*, and KS Ravichandran.  
   [Download PDF](#)

103. **Antimicrobial Activity Studies on Seed Fibers of Wrightia tinctoria (Roxb.) R.Br.**  
   Keerthi Priya Yadala, T S Gopenath, R Bharath Kumar, and Asha S*.  
   [Download PDF](#)

104. **Phylogenetic of Rhacophoridae (Amphibia: Anura) from Sumatra based on Cytochrome-b gene.**  
   Neqita Deliana Benita, Dewi Imelda Roesma, and Djong Hon Tjong*.  
   [Download PDF](#)

105. **Preparation, thermal, antimicrobial efficiency and spectroscopic characterizations of Ce(III), Gd(III), Nd(III), Tb(III) and Er(III) eosin yellow complexes.**  
   Akram M El-Didamony, Mohamed Y El-Sayed, Hammad Fetoooh, Eman SE Abd El-Maksoud and Moamen S Refat*  
   [Download PDF](#)

106. **Role of CD56 In Diagnosing Small Cell Lung Carcinoma on A Limited Tissue Sample with Marked Crush Artifacts - A Case Report.**  
   D Krishna Dev, Swati Sharma*, Ranjini Kudva, and Manna Valiathan.  
   [Download PDF](#)

107. **Survey on Energy Efficiency Protocols in Wireless Body Area Networks (WBANs).**  
   Ali Abdulla, Swathi Singh, Toni Christo, and Ananda Kumar S.  
   [Download PDF](#)

108. **A Survey On E-Learning Based Mobile Cloud Computing.**  
   Bidisha Pyne*, Swarnendu Kundu, and Ananda Kumar S.  
   [Download PDF](#)

109. **Forest Fire Detection: A Survey.**  
   X Stella Infanta*, and B Santhi.  
   [Download PDF](#)

110. **Wavelet Based Hybrid Compression and Color Clustering Segmentation Algorithm on CT/PET Images for Telemedicine Applications.**  
   Pramod S*, and Ashish Payal  
   [Download PDF](#)

111. **Simulation Of Non Deterministic Cellular Automata By Boolean Circuits.**  
   Nisha VM*, and Sajidha SA.  
   [Download PDF](#)

112. **Caralluma lasiantha: A review on it’s vital role in Indian Traditional Medicine.**  
   Sireesha Malladi, Venkata Nadh Ratnakaram*, Suresh Babu K, and Pullaiah T.  
   [Download PDF](#)

113. **Modeling of the electrical resistivity of vegetable oils: Palm and Prickly pear oil.**  
114. Develop Prescription Food Compositions Intended for Individual Meals.
    Vladimir Vsevolodovich Sadovoy*, Irina Alexandrovna Trubina, Tatiana Viktorovna Shchedrina, and Elena Alexandrovna Scorbina.
    Download PDF

115. Assessment of the Opinion of Iranian Dentistry Students, about Training Method and Equipment in the Dental Prosthodontics Department.
    Sina Safari, Molook Torabli Parizi*, Hadi Nader Zadeh, and Marjan Kheirmand Parizi. Download PDF

116. Opto-electronic properties and molecular design for photovoltaic applications of new materials based on 1-aza-azulene.
    T Sahdane*, A Laghrabli, R Benallal, H Bougharraf, B Azize, and B Kabouchi. Download PDF

117. Risk of Sharps and Needle Stick Injuries among health care workers in a Teaching Hospital, southwest of Iran.
    Sahar Geravandi, Farid Yousefi, Seyed Mohammad Alavi, Sasan Moogahi, Mohammad Mahboubi, Zohreh Dehkordi, Bayram Hashemizadeh, Ahmad Reza Yari, Yusef Omidi Khanibadi, Masoud Torabpour, Mohammad Javad Mohammad*.
    Download PDF

    J Sivasri, B T P Madhav, M C Rao, and R K N R Manepalli*. Download PDF

119. Mixed ligand complexes of Copper(II), Nickel(II) and Zinc(II) with salicylaldehyde tyrosine Schiff base and dimethylaminopyridine/dimethylaminopyridine and Phenanthroline - Synthesis, Spectral characterization and Biological Studies.
    G Brindha, and R Vijayanthershima*. Download PDF

120. Classification of Thyroid Disease Using ACO-MST Techniques.
    Poornima M, Sumathi A, and Meganathan S*. Download PDF

121. A Survey On The Applications Of K-Nearest Neighbour Algorithm And Its Variants.
    S Preethi*, and PLK Priyadarsini. Download PDF

122. Improving Functional and Sensory Properties of Brown Sugar With Addition of Nutmeg Powder.
    Neswati. Download PDF

123. Experimental and Statistical Studies on the Adsorption of Lead in Aqueous Solution using Activated Carbon from Bauhinia Purpurae Leaves.
    H Joga Rao*, P King, and Y Prasanna Kumar. Download PDF

124. The impact of the specialized products on the resistance of animals to the X-ray irradiation.
    KA Saparov*, Z Yessimsiitova, BA Abdullayeva, IM Zharkova, SA Mankibaeva, and B T Tynbekov. Download PDF

    J Sethuraman*, C Vijayabanu, and V Srinivasakumar. Download PDF

    Angreni Ayuhastuti*, Anisha Noviani Agustin, and Siti Rahmani Fauzyyah. Download PDF

127. Mechanical Properties and Microstructure of Kenaf-Hair Hybrid/Epoxy Composites.
    Siva R*, Goku K, Vigeshwaran K, Mahamed Naveed Khan Patan, and Purusothaman M. Download PDF

    R K N R Manepalli*, M Tejaswi, M C Rao, G Giridhar, B T P Madhav, and V G K M Pisipti. Download PDF

130. Uterine Prolapse in a Jersey-Red Sindhi Cross Cow.
    N Kasturi*, M Selvaraju and S Sendivelan. Download PDF

131. Osteoporosis and its implications in dentistry.
    Ketaki Kamath*, and Dhanraj Ganapathy. Download PDF

132. Synthesis, Characterization and TGA Studies of Co (II), Ni (II) and Zn (II) Complexes of 3-(2-(4-hydroxy-3-methoxy benzylidene) hydrazinyl)-2H-benzo[b] [1, 4] oxazin-2-one Schiff Base.
133. Heart Rate Variability in Athletes Specializing in Middle-Distance Running during Mesocycle.
Kavitha N, and Anantha Lakshmi PV*. Download PDF

134. Effect of low frequency electromagnetic treatment on raw meat.
Anton Alekseevich Nesterenko*, Andrey Georgievich Koshcaev, Nadezhda Viktorovna Keniiz, Damir Saferbievich Shhalahov, and Kristina Rudol’fovna Vilts. Download PDF

Anton Alekseevich Nesterenko*, Andrey Georgievich Koshcaev, Nadezhda Viktorovna Keniiz, Damir Saferbievich Shhalahov, and Kristina Rudol’fovna Vilts. Download PDF

136. Reproductive and fattening quality of pigs various genotypes.
Vladimir Anikeevich Pogodaev*, Anatoly Nimeevich Arilov, Anatoly Foadovich Shevhuzhev, Alexandr Pavlovich Marynich, and Rashid Hasanbievich Kochkarov. Download PDF

137. Complex assessment of meat efficiency and quality of meat rabbit breed "Chinchilla"

Rashmi Khemani, Swati Sharma*, and Manna Vaiithan. Download PDF

139. Torsion of the ovary with incidental finding of Teratoma: A Case Report
Ekta Jajodia, Swati Sharma*, and Manna Vaiithan. Download PDF

140. Formulation and Evaluation of Sustained Release Dosage Form of Metformin Hydrochloride using A Combined Hydrophobic and Hydrophilic Matrix
Sundara Moorthy K*, and Sampathkumar KP. Download PDF

141. Analysis and Relative Extraction Optimization of Betulinic Acid Using RP-HPLC From Various Parts of Ziziphus Jujuba L.
Dhirendra Kumar, and Kashyap Kumar Dubey*. Download PDF

142. Overall assessment of drinking water security that reaching the consumers.
Tunakova YA*, Novikova SV and Gabdrakhmanova GN. Download PDF

143. Formulation and Development of Oro-Dispersible Tablets of Metoclopramide Hydrochloride Using Different Taste Masking Agents.
Rakhee K Kotecha*, Anil V Chandewar, and Anand S Surana. Download PDF

144. Addition Of Weissella Paramesenteroides As Probiotic In Liquid Soap From Abdominal Fat Cattle.
Sri Melia, Afriani Sandra, Arif Trisman, Hendri Purwanto, and Endang Purwati*. Download PDF

145. Detection and eradication of major microbial contaminants during callus culture of Sugarcane (Saccharum officinarum L.) genotype Co 86032.
Virdhaval M Nalavade*, Mokshadaa R Naidu, Ravindra R Kale, Avinash S Thorat and K Harinath Babu. Download PDF

146. Insilico docking studies for investigating the anticancer properties of plant based compounds against cervical cancer.
Aishwarya Deshpande, Keerthi Kesavan, and Jayanthi Sivaraman*. Download PDF

147. Entamoeba histolytica Infection in Infancy as a Cause of Diarrhea in Baghdad Private Laboratories
Dhilal Mahdi Al-Muathen*. Download PDF

Imane Nechad*, El Hassan El Harchli, Imane Hinchi, and Fatima Fadil. Download PDF

149. fALSdb – Mutation Browser for SOD1 Mutations causing Amyotrophic Lateral Sclerosis (ALS).
Udayakumar M*, Senthilkumar R, BharathramU, and Shrivatsan AD. Download PDF

150. Lornoxicam Sustained Release Tablets: Formulation, In-Vitro Evaluation and Comparison with Marketed Lofecam SR.
Sangeetamohanaty*, Abhisek Pal, Sudam Chandra SCI. Download PDF

151. Risk Alleviation Of Pesticides In Agriculture: From History To Analytical Techniques.
Jojiya Grace George, and Aneesh TP*. Download PDF
152. The Technology of Obtaining High-Quality Seeds of Sugar Beet.  
Kukharev ON, Polikanov AV, Semov IN*.  
[Download PDF]

Preeti Namedeo*, Rupinder Kaur Sandh, and M Venketesan.  
[Download PDF]

M Manimaranboopathi*, G A Sathish Kumar, and M Anto Bennet.  
[Download PDF]

[Download PDF]

156. Study the Effect of Eruca Sativa Leaves Extract on Serum Total protein, Sodium & Potassium Ions in Male Rats.  
Iman H alrikabi*.  
[Download PDF]

Neelanjan Bhattacharyya*, Anthanna Sandeep, and Venketesan M.  
[Download PDF]

158. Identification of Bacteria Causing Subclinical Cow Mastitis: Comparative 16S DNA Sequence Analysis and Biotyping Using MALDI-TOF MS.  
Assia GUENDOUZE*, Ahmed DJEGHADER, Yasmine OUCHERIAH, and Mohamed Abdelhafid HAMIDECHI.  
[Download PDF]

159. Prevalence of Urinary Tract Infection and Associated Microorganisms in Iran: A meta- Analysis Study

Thrombolytic Activity of Fibrinolytic Enzyme from Black Soybean Tempeh (Glycine Soja Sieb. Et Zucc) Fermented by Rhizopus Oligosporus FNCC 6010.

Achmad Toto Poernomo*, and Isnaeni, Purwanto.

ABSTRACT

Tempeh is a famous Indonesian traditional fermented food. It is made by various soy and legumes as raw materials. In this research, black soybean (Glycine soja sieb. et zucc) is used as a substrate for fermentation process by fibrinolytic enzyme producing Rhizopus oligosporus FNCC 6010. Optimization of the fermentation process was performed by temperature and inoculums concentration. The tempeh fibrinolytic enzyme (TpFE) was extracted from the tempeh by water and centrifuged to separate supernatant from solid materials. Ammonium sulfate was used for partially the TpFE purification. The enzyme activity was tested by fibrin plate. It was found that the TpFE activity from the supernatant is 2,745 U/ml with a protein concentration of 10.358 mg/ml and specific activity is 0.265 U/mg. Furthermore, increasing concentrations of ammonium sulfate for partial purification was affected the TpFE activity. The higher concentration of ammonium sulfate is the lower the enzyme activity. The maximum activity of fibrinolytic was obtained at a temperature of 45 ºC. The highest activity of the fibrinolytic enzymes (22,851 U/mL) was achieved at pH 5.5. Addition of Ca**, Co** and Mn** in the fermentation media lead to increase the TpFE activity, 23.653 U / ml, 22.262 U / mL and 21.566 U / ml respectively. Trombolitic activity in vitro clot lysis results in a decrease to 97.6%.

Keywords: Black soybean tempeh, Rhizopus oligosporus, Thrombolytic activity, fibrinolytic enzyme

*Corresponding author
INTRODUCTION

The fibrinolytic enzymes of microbial origin that are able to dissolve endogenous thrombi in vivo were reported. Mechanism action of the fibrinolytic enzymes as thrombolytic was also studied with special focus on the structure and character of the enzymes. Streptokinase, for example, is produced by b-hemolytic streptococci and exerts its enzyme action indirectly by activating plasminogen. On the other hand, staphylokinase is produced by *Staphylococcus aureus* by stoichiometric complexation with plasminogen which activates other plasminogen molecules. Serrapeptase is a different fibrinolytic enzyme produced by enterobacterium *Serratia* sp. E-15 with multiple functions including fibrin degradation. In addition, nattokinase is one of the fibrinolytic enzymes, produced by *Bacillus* natto, derived from fermented food [1]. On the other hand, the available thrombolytic agents are very expensive and cause side reactions such as increasing the risk of unwanted bleeding internally in the intestine channel when used orally.

Thrombolysis therapy with thrombolytic agents, such as alteplase, anistreplase, streptokinase, urokinase and tissue plasminogen activator (t-PA) is often used to degrade the clot formed in vascular disease. Therefore, the agent thrombolytic still continues to be developed to obtain a therapeutic agent with a lower risk of side effects as well as a relatively affordable cost [2]. Research on isolation and screening activity of fibrinolytic enzymes from many microorganisms as agents of thrombolysis has been reported. Fibrinolytic activity on various fermented foods from Korea (Chungkookjang and Doen-jang, Jeot-gal); Japan (natto) has been studied. Tempeh soybeans fermented by *Fusarium* sp has also been studied to produce proteolytic enzymes that have fibrinolytic activity [1]. Tempeh is Indonesian traditional food that is processed through fermentation technology by using soybean and *Rhizopus* spp. [3]. The soybean tempeh fermented by *Rhizopus* spp. could be able to produce proteolytic enzymes that are potential as fibrinolytic agent [4]. Most of the tempeh made with basic ingredients of soy, but can also be made from a wide variety of beans such as black soybean (*Glycine soja* sieb. et zucc), koro bean (Mucuna pruriens), red bean (*Phaseolus radiatus*), and tunggak bean (*Vigna unguiculata*). Peng et al. (2003) [5] have managed to do a purification of fibrinolytic enzymes of *Bacillus amyloliquefaciens* DC-4 from dochi, the traditional food of Chinese origin made of soy. In addition, purification of fibrinolytic enzyme nattokinase from *Bacillus subtilis* TKU007 has been carried out by [6]. In his research, nattokinase obtained through purification with a 3-stage procedure that precipitation with ammonium sulfate. This research, the thrombolytic activity of TpFE extract from black soybean (*Glycine soja* sieb. et zucc) fermented by *Rhizopus oligosporus* FNCC 6010 has been investigated. The performed a partial purification and characterization of the influence of pH, temperature, and metal activator has been performed. In addition to testing the thrombolytic activity using clots lysis.

MATERIAL AND METHODS

Materials

Fibrin, thrombin, fibrinogen and plasmin (all from human plasma), nattokinase, and tyrosine (Sigma-Aldrich, St. Louis, MO, USA). Sephadex 50 (Pharmacia, Uppsala, Sweden). All other chemicals and reagents used are analytical grade.

Microorganism and maintenance of culture

*Rhizopus oligosporus* FNCC 6010 was derived from Microbiology Laboratory, PAU Pangan Gizi Gadjah Mada University and grown on potato dextrose agar slants at 30°C for 3-5 days and stored at 4°C. The stock culture was revived on fresh agar slants medium for the whole experiment.

Collection of legume for tempeh production

The black soybean (*Glycine soja* sieb. et zucc) was obtained from Indonesian Legumes and Tuber Crops Research Institute in Malang, East Java, used as raw material for tempeh production.
Preparation of tempeh [7]

Producing tempeh from black Soybean (*Glycine Soja* Sieb. Et Zucc) fermented by the *Rhizopus oligosporus* FNCC 6010 spores obtained a compact mass texture and homogenous structure as well as taste, smell and distinctively flavored tempeh. Yellowish white, but white color evenly on the surface is due to the presence of mycelium growing on the surface of the seed legume after 44 hours incubation (Figure 1). The tempeh texture can be determined by identification of dense surface mycelia. If the mycelia were lush, it indicates that the texture of tempeh has a compact, and vice versa. *Rhizopus oligosporus* FNCC 6010 is obligate aerobes, so the availability of oxygen absolutely is rate determinate factor for the fermentation process. Incubation for the tempeh preparation was carried out at Laminar flow cabinet to minimize contamination during the experiment. The specification of the tempeh produced was appropriate to national food standard.

Qualitative screening for proteolytic enzyme production

About 20,0 mg of tempeh extract was plated onto protein agar plates containing skim milk powder 100 mg, peptone 5g and agar 20g per liter at pH 5.0, incubated at 37°C for 24 h. A clear zone of skim hydrolysis has appeared from protease producing samples. The diameter of the clear zone was observed and measured.

Qualitative screening of fibrinolytic enzyme [8]

In a 90 mm petri dish, 5 mL of 0.5% w/v fibrinogen from bovine plasma in 50 mM Tris-HCl buffer (pH 7.8) mixed with 5 ml of 2% (w/v) agarose and 0,1 ml of thrombin (100 NIH U/ml). Petri dish is allowed to stand for 30 minutes at room temperature to form a layer of white clouded fibrin clots. Half of the petri dish is heated at 85°C for 30 minutes to deactivate plasminogen (plasminogen petri dish free fibrin obtained) and the remaining is considered rich fibrin plasminogen. Furthermore, 10 µl of each crude enzyme extract was dropped carefully on surface media. The petri dish was incubated at 37oC and then observed every 6 hours for 18 hours. The fibrinolytic activity was observed as observed by measuring the clear transparent zone. The clear transparent zone indicate degradation of fibrin and its diameter is proportional to the TpFE potency. All experiments were performed three times.

Effect of pH

Optimization of medium pH was performed by maintaining the pH using various buffer solutions such as glisin-HCl (pH 2.0-3.5), acetic 0,05 M (pH 3.5-5.5), phosphate 0,05 M (pH 5.5-8.5), and glisin-NaOH 0,05 M (pH 8.5 - 12,0). Each media was inoculated by culture and grown for 24 hours at optimum temperature. The culture was filtered and the filtrate was centrifuged at 10,000 rpm for 10 min and supernatant was assayed for the fibrinolytic enzyme activity.

Effect of temperature

The optimization of temperature, the activity of the fibrinolytic enzyme was observed at various temperatures (37- 80°C) in 0.05 M phosphate buffer solution pH 7.0.

Effect of inoculum volume

The volume of inoculum used to optimise the enzymes production was arranged at 0,5, 1.0, 1,5, 2.0 mL. The black soybean was depped in water for 16 hours, incubation was done at 30°C for 36 hours.

Effect of metal ion [9]

The effect of metal ion was performed by incubating 100 uL enzyme solution added by 100 uLmetal ion solution until the final concentration of 1 and 5 mM at room temperature for one hour. The enzyme activity was assayed quantitatively. The metal ion used were KCl, NaCl, CaCl₂, CuCl₂, CoCl₂, MgCl₂, MnCl₂, ZnCl₂ and FeCl₃.
Extraction of TpFE enzyme

About 150 grams dried tempeh (by adding liquid nitrogen) were cut in the shape of cubes, put in a mixer with filters and add 250 mL of buffer phosphate 0.05 M pH 7.0 solution. The homogenate was destroyed and poured into the tube, centrifuged at 4°C, 9000 rpm for 10 minutes. The supernatant was separated and lyophilized to gain powder. The powder dissolved in 20 mL of pH 7.0 phosphate buffer solution.

Purification of TpFE by ammonium sulfate fractionation

Fractionation of 0 % - 30 %. Supernatant obtained from crude extract was concentrated by adding ammonium sulfate with varying degrees of saturation. The mixture was stirred on an ice bath up to dissolved, added by 3.28 g of ammonium sulfate, centrifuged 6000 rpm at 4°C in centrifuge refrigerator for 10 min. The supernatant was taken for treatment of ammonium sulfate. Fractionation of 30 % - 50 %. The first precipitate dissolved with phosphate buffer pH 7.8 solution and continued by dialysis (cut off 12 kd ) process. Fractionation of 30% - 40 %. The supernatant of 0 – 30% was stirred on an ice bath up to dissolved, added by 1.22 gram of ammonium sulfate. Fractionation of 40%-50%, 50%-60% and 60% - 80% were conducted with the same way as described above and added of ammonium sulfate 1.24, 3.26 and 3.50 g respectively.

Process of dialysis with cellophane tube

Firstly, the cellophane tubes were prepared for each precipitate, and cut into 15 cm and washed by soaking in water at 80 °C for 3 hours. Furthermore, the end of the cellophane was tied with a binder. Secondly, a solution of 0.05 M phosphate buffer pH 7.0 prepared in Beaker glass. Each of the precipitates of fraction 0-30%, 30-40%, 40-50%, 50-60% and 60-80% was dissolved into 10 mL of 0.05 M phosphate buffer pH 7.0 and then each solution was put into a cellophane tube and tied the other end to form a bag. Each cellophane bag containing the enzyme solution soaked into Beaker glass containing phosphate buffer, stirred with a stirrer for 12 hours in a 4 °C ice bath. Replacement of phosphate buffer solution was performed every 4 hours. Activity test was carried out on each of enzyme solution obtained from dialysis process.

Fibrinolytic enzyme activity assay:

The activity of TpFE was assayed by measuring the α-amino nitrogen liberated. A mixture consisting of 50 ul enzymes, 500 ul of 100 mM Tris-HCl buffer solution at pH 4.5, 100 ul of 3% fibrin substrate and coupled to 1 ml of distilled water was incubated at 37 °C for 1 hour, and then stopped by the addition of 200 ul of 20% trichloroacetic acid (v/v). After centrifugation, 0.5 ml of the supernatant was added to 1 ml of ninhydrin reagent (0.5 ml of 1% ninhydrin in 0.5 M citrate buffer, pH 5.5, 0.2 ml of the buffer, and 1.2 ml of glycerol) and boiled for 10 minutes. Four ml of distilled water was added to each sample and measured the absorbance at 570 nm and the increase in free amino groups was determined. Tyrosine is used as a standard. One unit of proteolytic activity was defined as 1μmol of the α-amino acids released per minute under the standard of testing conditions.

Thrombolytic activity assay (Blood Clot Lysis)

The clot lytic effect of the fibrinolytic enzyme was studied with an artificial clot in vitro. The blood was collected from healthy mice with written informed consents. The artificial blood clot was made by spontaneous coagulation in the centrifuge vials. Then, different doses (100, 200, and 300 units) of the fibrinolytic enzyme were added. Nattokinase (250 units) was used as the positive control; buffered saline solution was used as the negative control. These were incubated at room temperature for 25, 50 and 75 min analyzed. After incubation, fluid obtained was removed and tubes were again weighed to observe the difference in weight after clot disruption. The difference obtained in weight taken before and after clot lysis was expressed as a percentage of clot lysis. The test was repeated five times.
RESULTS AND DISCUSSION

Preparation of *Rhizopus oligosporus* FNCC 6010 inoculums

*Rhizopus oligosporus* taken from stock culture was transferred to fresh potato dextrose slant agar media, incubated for 72 hours at 30°C. Regeneration of cells successfully produced white and can be turned into a blackish color/dark, and when viewed from the surface of the fibers such as cotton. The *Rhizopus oligosporus* spore was collected by added 10 mL saline solution and the transmittant of the culture suspension measurement was performed to obtain reproducible condition. Number of cells used for fermentation processes was $10^7$ CFU/mL.

Preparation of tempeh

Producing tempeh from black Soybean (*Glycine Soja* Sieb. Et Zucc) fermented by the spores of *Rhizopus oligosporus* FNCC 6010 obtained a compact mass texture and homogenous structure as well as taste, smell and distinctive flavored tempeh. Yellowish white, but white color evenly on the surface is due to the presence of mycelium growing on the surface of the seed legume after 44 hours incubation (Figure 1). The tempeh texture can be determined by identification of dense surface mycelia. If the mycelia was lush, it indicates that the texture of tempeh has a compact. *Rhizopus oligosporus* FNCC 6010 is obligate aerobes, the availability of oxygen absolutely is rate determinate factor for the fermentation process. Incubation for the tempeh preparation was carried out at Laminar flow cabinet to minimize contamination during the experiment. The specification of the tempeh produced was appropriate to national food standard (Table 1).

**Qualitative screening for proteolytic enzyme activity**

It was found that the tempeh extract produced clear zone sizes that were proportional to *Rhizopus oligosporus* growth size, while some colonies, even if their colony sizes were relatively small, they have exceptionally big clear zones around them (Figure 2). To equalize this, a parameter called relative halo size was determined by the following equation:

\[
\text{Relative clear zone} = \frac{d \text{ clear zone} - d \text{ colony}}{d \text{ colony}} \times 100
\]

In which \(d\text{ clear zone}\) is diameter formed around the colony (mm), while \(d\text{ colony}\) is the diameter of the colony (mm).

![Figure 2: Proteolytic activity of *Rhizopus oligosporus* FNCC 6010 spores on skim milk agar plates (a) and proteolytic activity of a slice of the tempeh fermented by *Rhizopus oligosporus* FNCC 6010 (b)](image)

**Qualitative screening for fibrinolytic enzymes activity**

Fibrin plate test conducted on agarose-fibrin media containing fibrinogen mixed with thrombin and metilen blue. It was found that the mixture of fibrinogen and thrombin formed cloudy white color on agarose media. Turbid white blobs are called fibrin. Samples (5 μL) containing fibrinolytic enzyme caused fibrin in the plate degraded to form clear zones. Observations were made after 3 hours treatment. The radius of a clear zone will be enlarged after more than 3 hours. Within 3 hours of the screening test indicate that the black soybean tempeh (*Glycine Soja* Sieb. et Zucc) produced hydrolyzed regions diameter was larger compared to other legumes. Preliminary qualitative screening showed that the *Rhizopus oligosporus* FNCC 6010 exhibited proteolytic activity as well as the tempeh produced by the fungi (Figure 3). The ability of proteolytic enzymes production was differ depending on the media used. The media will also cause a variety of legumes degraded by *Rhizopus oligosporus* producing different proteolytic enzyme activity. Screening of bacteria and fungi that produce fibrinolytic enzyme reported by [10] have successfully produced ninety-four fibrinolytic enzyme-producing bacterial colonies using soybean substrate. Likewise, Kumaran et al. 2011 has screened the enzyme on *Ganoderma lucidum*. 
Enzyme extraction and partial purification

Enzyme divided into intracellular and extracellular enzymes. This will give the effect of extraction and purification methods. Enzyme extraction process can be done by homogenization, centrifugation, filtration, or their combination. The first stage of extraction is the addition of phosphate buffer pH 7.2 and homogenized by destroying at 4 °C so that it becomes a suspension. Separation of supernatant and pellets was done by filtration. Furthermore, centrifuged at low temperatures 4 °C with a speed of 9,000 rpm for 10 minutes. Centrifugation carried out at low temperatures with the aim of maintaining the enzyme remains active. Then the pellet was extracted again. The resulting supernatant was added buffer solution, allowed to stand for 48 hours to obtain the cell-free supernatant of crude extract fibrinolytic enzymes. Enzymes have been extracted in the supernatant still form an aqueous solution with a low enzymatic activity and still contains many impurities.

From the experimental obtained the crude extract of fibrinolytic enzyme activity of 0.030 U / mL and the specific activity of 0.025 U / mg. Thus, the concentration needs to be done through the use of ammonium sulfate precipitation of crude extract to the saturation of the enzyme with different concentrations ranging from the lowest saturation concentration of 0-30, 30-40, 40-50, 50-60, and 60-80 %. Precipitation with ammonium sulfate was based on salting out mechanism, so there is competition between ammonium sulfate ions with ion binding protein in water. The higher concentration of ammonium sulfate, the greater density of ionic ammonium sulfate is compared to the protein. The result showed that water molecules are bound to the greater salt. Decreased water molecules in hydrophobic amino acid residues caused attractive forces between molecules of protein increase when compared to the attractive forces between the protein molecules with water molecules so that the protein will precipitate. During the salting out process, salt concentration must be kept so as not decrease in the solution, so that no precipitation occurs simultaneously between purified proteins and undesired proteins. In this study, ammonium sulfate precipitation aims to separate between the fibrinolytic enzyme with another enzyme partially purified from the crude enzyme, thus fibrinolytic enzymes have higher activity than the crude extract.

The fibrinolytic enzyme activity was greater in precipitate compared to the supernatant (Fig. 3 and Fig. 4). The addition of ammonium sulfate of 0-30% saturation obtained the fibrinolytic enzyme activity in the supernatant 2,745 U/ml with a protein concentration of 10.358 mg /ml and a specific activity of 0.265 U/mg. Increasing concentrations of ammonium sulfate lead to decrease the enzyme activity in the supernatant, 0.905 U/ml with a protein concentration 4.719 mg/ml (Fig. 4) and the specific activity of 0.191 U/mg at a concentration of 80% saturation.

Figure 3: Profile of fibrinolytic enzyme activity and total protein in the precipitate (pellet) on a variety of percent saturation of ammonium sulfate with phosphate buffer pH 7.
The fibrinolytic enzyme activity decreased in the supernatant indicates that the protein including fibrinolytic enzyme was precipitated by the addition of ammonium sulfate. The increasing saturation of 80% makes the fibrinolytic enzyme activity increased up to a maximum of 157.454 U/ml with a protein concentration has been precipitated 20.258 mg/ml (Fig. 3) and the specific activity of 7,772 U/mg.

Figure 4: Profile of fibrinolytic enzyme activity and total protein in the supernatant on a variety of percent saturation of ammonium sulfate with phosphate buffer pH 7

Figure 5: Profile of fibrinolytic enzyme activity influenced by temperature with phosphate buffer pH 7.

Figure 6: Profile of fibrinolytic enzyme activity influenced by pH, glycine-HCl buffer (pH 3.0 to 3.5), 0.05 M acetate buffer (pH 3.5-5.5), 0.05 M phosphate buffer (pH 5.5 to 8.5), and glycine-NaOH buffer 0.05 M (pH 8.5 to 12.0).
Figure 7: Profile of fibrinolytic enzyme activity in a variety of metal ions KCl, NaCl, CaCl$_2$, CuCl$_2$, CoCl$_2$, MgCl$_2$, MnCl$_2$, ZnCl$_2$ and FeCl$_3$ concentrations of 0.05 mM respectively.

**Effect of temperature**

Temperature variation is used to determine the optimum temperature is a fibrinolytic enzyme in the range of 30 °C to 80 °C. To reduce the possibility of interference residual peptides formed during the degradation of the substrate protein (fibrin) then after enzymatic reaction of acetic acid is added trichloroacetic acid. The precipitate was separated by centrifugation 9000 rpm 4°C. Increasing the temperature of the chemical reaction rate will be faster. In Figure 7, the maximum activity is achieved at a temperature of 45°C with phosphate buffer pH 5.5 for 10 minutes. The enzyme activity reached 13,707 U / ml. The increase in activity of the enzyme is due to the kinetic energy resulting vibrational motion, translation and rotation of the enzyme and the substrate so that the enzyme substrate interaction becomes larger and faster. At temperatures above 50°C (above the optimum temperature), fibrinolytic enzyme activity was gradually decreased due to protein denaturation. Enzymes are protein molecules that can be denatured at high temperatures as well. The catalytic activity gradually increased as the temperature rises to the limit and the higher temperatures resulting in increased damage to the enzyme. As research on the enzyme activity of fermented solid fibrinolytic SSF (solid state fermentation) of the fungus *Rhizopus chinensis* 12, *Pleurotus eryngii* and *Pleurotus sajor - caju*. Fibrinolytic enzyme activity decreased after the temperature of 50°C [12][13], [14].

Fibrinolytic enzymes from *Bacillus firmus* NA - 1 isolated from Natto, a traditional Japanese fermented food [15] and from *Bacillus* sp strain CK 11-4 isolated from Chungkook -jang, a traditional food of Korea [16], has been reported to be relatively stable at a temperature of 40 °C. While the fibrinolytic enzyme isolated from *Bacillus subtilis* LD - 8547 is reported to have activity between 35°C and 65°C with optimum activity at a temperature of 50°C. The fibrinolytic enzyme is very stable at a temperature of 45°C after 60 min incubation and showed 82 % and 11 % residual activity respectively at a temperature of 60°C and 70°C after 60 minutes, but at 75°C for 10 minutes, fibrinolytic enzyme activity is lost. Performed on the lyophilized enzyme and stored at 4°C, its activity did not change after 2 months and after freezing then performed dissolution, fibrinolytic activity remained stable [10].

**Effect of pH**

Most of the enzyme showed optimal activity at pH between 5 and 9. Changes in the structure of the enzyme will affect the rate of reaction. The relationship between the activity of the enzyme with a concentration of hydrogen ion showed that the equilibrium between the denaturation of enzymes at high or low pH and its effect on the condition of the enzyme charge, the substrate, or both. At the time a certain medium pH changed, will result in changes in enzyme form. Not only on the enzyme, the pH level can also change the nature of the charge and form of the substrate. If only there was a slight change in its pH change
the structure of enzymes and its substrate to reversible (irretrievable). But significant changes that would make the pH level and in denaturing, its substrate to an enzyme so that it can perform its function normally in the enzyme will be changed. The enzyme has an amino group and a carboxyl group. Both of these groups are affected by the strength of the hydrogen ions that will result in the catalytic and enzymatic changes of conformation. These changes will be indicated when enzyme activity was treated at the pH range is between 3 to 12.

The research was carried out the determination of the optimum pH of the fibrinolytic enzyme to partial purification results. These characteristics are needed because, the enzyme has many functional groups that can be ionized so that it changes the pH will change the conformation of the enzyme, the binding of the substrate and the catalytic power of the functional groups on the active enzyme. Changes that may occur is the maximum rate of the enzyme, changes in the stability of the enzyme. It looks that have the highest activity of fibrinolytic enzymes to achieve optimal at pH 5, is 22,851 U/mL and at pH 5.5 still showed its activity despite the ability of the enzyme to hydrolyze started having decreased. Then fibrinolytic enzyme activity is continuing to decrease after pH 7 to 12.

The interaction between the fibrinolytic enzyme with the solvent will result in ionization occurs on the active site. If the pH is low or below the optimum pH or pH levels above pH optimum, it will be directly in contact with the active site, the result will be a rapid decrease in enzyme activity. Beyond the optimum pH, lower fibrinolytic enzyme activity due to characterize of the enzyme protein molecules that have positive and negative charges. Ionization of amino acids in the active site of the enzyme is such that it allows the electrostatic interaction between the enzyme active site to the substrate to form the enzyme-substrate complex. Based on Figure 6, note that the fibrinolytic enzyme extracted from black soybean tends to work in an acidic environment. In a study carried out by Cui et al. (2008) [17] at Cordyceps militaris fungus that the fibrinolytic enzyme activity reached an optimum at pH 6. It is very different from other fibrinolytic enzymes have been reported. In general, like the nattokinase most active in the alkaline pH range [18]; [19]; [20]. Moreover, the enzyme is very stable in the pH range 5.0-8.0, 37 ° C for 1 hour, but above pH 8.0, the stability of the enzyme decreased very rapidly.

Effect of metal ions

Fibrinolytic enzymes in their activities need additional cofactors. Most enzymes require non protein co-factors for catalysis. The co-factor is usually as trace elements with small concentrations are able to increase the activity. The metal salts of inorganic compounds such as potassium, sodium, calcium, copper, cobalt, magnesium, manganese, zinc or Fe. Usually, as inorganic salts produce an effect on the apoenzyme to form an active holoenzyme. During the time that others can be as co-substrate cofactors that bind covalently to the enzyme.

In this study, all metal ions derived from the chloride, not others. It is avoided that the ionization is always uniform in the same salt. In the implementation of the cation is added to a solution of the enzyme so that it gets the same concentration of 0.05 mM at the time of fibrinolytic enzyme activity assay. The addition of Ca**, Co** and Mn** indicates that fibrinolytic enzyme activity 23.653 U / mL, 22.262 U / mL and 21.566 U / mL respectively was greater than control or other metal ions (Fig. 7). Increasing activity of this enzyme could be due to the presence of inhibitors of the enzyme removes the enzyme solution (1), change the surface tension of the enzyme (2), replace other metal ions in the enzyme active site (3) or may also change the conformation of the enzyme (4). During the time that other metal ions did not produce an effect on or even decrease the activity of the fibrinolytic enzyme. Increasing activity of fibrinolytic enzyme from Armillaria mellea by Ca** to 126.4% has been reported by [21].

Thrombolytic activity assay

The lyophilized crude enzyme was characterized and assayed for thrombolytic activity. Table 2 showed the thrombolytic activity at 250U/ and 500 µl concentration of the crude enzyme expressed as average of decreasing of blood clot after 25s, 50s, and 75s treatment (Fig. 8).

CONCLUSION

*Rhizopus oligosporus* FNCC 6010 showed fibrinolytic enzyme activity in the media fibrin plate, Black soybean tempe fermented *Rhizopus oligosporus* FNCC 6010 showed fibrinolytic activity and thrombolytic. Characteristics of fibrinolytic enzyme leads to the nature of the aspartic protease is based on an optimum pH 5.5 and optimum temperature of 45°C. Characters fibrinolytic enzyme lead to the nature of the metal, which is influenced by the activator ion Ca ++, Co ++ and Zn. Trombolitic activity in vitro clot lysis results in a decrease to 97.6%
