

ABSTRACT**DISTRIBUTION AND DENTAL CHARACTERISTIC OF PAIN IN ADOLESCENTS AGE 12 – 17 YEARS IN JEMBER DISTRICT****ABSTRACT**

Introduction: *Distribution of cases of oral cavity pain from social aspects can be known from the sex, education as well as the work of parents. Research on the distribution and characteristics of dental pain in adolescents has been conducted in several countries. In Indonesia, research on the impact of toothache, distribution, and characteristics of dental pain widely in adolescents is still not widely done.* **Objective:** *to know the distribution and characteristics of dental pain in adolescents aged 12-17 years in Jember Regency.* **Method:** *descriptive research conducted in several junior high schools and high schools / vocational schools / MA in Jember district in November-December 2020 with a population of youth groups of active scout members. Convenience sampling techniques as many as 150 respondents using online questionnaires (Google Form).* **Results:** *Out of 150 respondents, 52 (34.7%) respondents experienced dental pain in the last 1 month, with an age range of 15 -17 years as much as 42 (37.2%), in the female sex as much as 39 (37.5%), attended high school / vocational school / MA as much as 39 (36.4%) and the socioeconomic level of the lower class as much as 34 (39.5%). Characteristics of moderate dental pain and the impact of mild dental pain were most common in this study.* **Conclusion:** *There is a relationship between variable age, gender, education level, socioeconomic level and background of respondents as active scout members to the severity of pain intensity in the characteristics of dental pain cases that occur and the impact of dental pain experienced by respondents.*

Keywords: *Dental pain, Distribution, Characteristics, Impact.*

ABSTRAK**DISTRIBUSI DAN KARAKTERISTIK *DENTAL PAIN* PADA REMAJA
USIA 12 – 17 TAHUN DI KABUPATEN JEMBER****ABSTRAK**

Pendahuluan : Distribusi kasus nyeri rongga mulut dari aspek sosial bisa diketahui dari jenis kelamin, pendidikan serta pekerjaan orang tua. Penelitian tentang distribusi dan karakteristik dental pain pada remaja telah dilakukan di beberapa negara. Di Indonesia, penelitian tentang dampak sakit gigi, distribusi, dan karakteristik dental pain secara luas pada remaja masih belum banyak dilakukan. **Tujuan :** mengetahui distribusi dan karakteristik dental pain pada remaja usia 12-17 tahun di Kabupaten Jember. **Metode:** penelitian deskriptif yang dilakukan di beberapa sekolah SMP/MTs dan SMA/SMK/MA di Kabupaten Jember pada November-Desember 2020 dengan Populasi kelompok remaja anggota pramuka aktif. Teknik convenience sampling sebanyak 150 responden menggunakan kuesioner online (Google Form). **Hasil :** Dari 150 responden, sebanyak 52 (34.7%) responden mengalami kejadian dental pain dalam 1 bulan terakhir, dengan rentang usia 15 – 17 tahun sebanyak 42 (37.2%), pada jenis kelamin perempuan sebanyak 39 (37.5%), bersekolah di SMA/SMK/MA sebanyak 39 (36.4%) dan tingkat sosial ekonomi kelas bawah sebanyak 34 (39.5%). Karakteristik dental pain moderate dan dampak dental pain ringan paling banyak terjadi dalam penelitian ini. **Kesimpulan :** Terdapat hubungan antara variabel usia, jenis kelamin, tingkat Pendidikan, tingkat sosial ekonomi serta latar belakang responden sebagai anggota pramuka aktif terhadap tingkat keparahan intensitas nyeri pada karakteristik kasus dental pain yang terjadi dan dampak dental pain yang dialami oleh responden. **Kata Kunci:** *Dental pain*, Distribusi, Karakteristik, Dampak.
