81. Molecular Detection of Toxogenic Cyanobacteria Isolated from Tigris River in Baghdad City –Iraq..... 446
Zainulabdeen H. A. AL-Khafaji, Ahmed S.Dwaish
82. Flame Atomic Absorption Spectrophotometry Analysis of Heavy Metals in Some Food Additives Available in Baghdad Markets, Iraq 451
Wasan Abdulwahid Jasim, Jassim Dawood Salman, Jasim Mohammed Shamar Jamur
83. Detection Malta Fever by Interferon-gamma and Steroid Hormone S Level 457
Ali Anok njum, Layla Saleh Abdul-Hassan Ihasan A. Hashem
84. Hepatic Toxicity in Patients with Rheumatoid Arthritis and Psoriasis Taking Methotrexate Therapy 463
Haider Hamza Omran, Basim Mohammed Mothlum
85. Scolicidal Activity of Zirconium Oxide (ZrO₂) nanoparticles Against Protoscolices of Hydatid Cysts..... 469
Amenah Abdul-Jabbar Ibrahim
86. Molecular Study of *Fimh* Gene in *Klebsiella Pneumoniae* Isolated From Urinary Catheter Patients 473
Israa Abdul Ameer Al-Kraety, Zahraa Hameed Oda Alquraishi, Aqeel A Alsadawi

87. Chemerin Level as a Marker in Preeclampsia and its Relation to the Disease Severity and Neonatal Outcome..... 478
Ali Mohammed Murad, Marwa Jaafar Sadac (M.B.Ch.B)2; Hanan Hazim Mohammed Noori (M.B.Ch.B, C.A.B.O.G, DGO)3
88. Production, Analysis and Optimization of Inulin Produced from *Pseudomonas fluorescens*..... 485
Alyaa Razooqi Hussein, Alaa Raheem Kadhim
89. Epidemiology of Hepatitis B and C in Al-Muthanna Province 492
Adian Abd Alrazak Dakl, Wafaa Ayad Alnuaimy
90. The Impact of Congenital Heart Diseases on Growth Parameters in Children and Their Correlations with Leptin Levels 495
Fouad Shareef, Amal Salih Mahdi Bayee
91. Hormonal and Mineral Imbalance Effect on Bone Resorption in Predialysis Iraqi Patients with Chronic Kidney Disease 501
Inaam Ahmed Ameen, Sarah Hashim Mhaibes, Shahad Wisam Ahmed, Kaled Nather Taha And Dhikra Abdul Hameed Dawood
92. Robust Controller Electromyogram Prosthetic Hand with Artificial Neural Network Control and Position 508
Saygin Ahmed, Aydin S. Ahmed, Bülent Yilmaz, Nuran Dogru
93. Study the Genotoxicity of Aqueous and Alcoholic Extracts of *Adhatoda Vasica* on the Roots of *Allium cepa* L. by RAPD-PCR Technique 514
Adnan Owayez Jasim, Mohammed Mahdi Jawad
94. Histological Study of the Effect of Isoxicam on Ovary of Albino Mice *Mus Musculus* 520
Ali Khudheyer Obayes, Wurood Mohamed Mutar, Rasha Hamid Ayub, Sahar Abdullah Mohammed
95. Genotyping of Tumor Necrosis Factor- α in Inflammatory Bowel Iraqi Patients 526
Inas Fadhe, Wafaa Sabri Mahood
96. Antibacterial activity of *Eruca Sativa* Seeds Aqueous Extract Against Human Pathogenic Bacteria..... 533
Madeha H. Hussain, Aml Hendi Salih, Rajaa Hendi Salih, Ali S. Hassoon
97. Possible Role of Toxoplasmosis on Gene Sequence Alteration in Patients with Cardiovascular Diseases .. 537
Nazar Sh. Mohammed, Ammer Abd. Mohammed, Salwa S. Muhsin
98. Article Deleted..... 541
99. Study the Cytochrome P450 Gene Expression Changes in Iraqi Patients with Chronic Liver Disease..... 546
Areej GH Al-Charak, Hamza H Kzar
100. The Reliability of Orthodontic Treatment, According to the Needs of Patients Using the Dental Aesthetic Index 551
Esraa Salman Jasim, Noor F. K. Al-Khawaja
101. Study the Protective Role of Arabic Gum Extract on Some Physiological and Histological Criteria for Liver of Male Rabbit Treated with Atrazine..... 558
Noor Rahi AL-Shimmari, Rasha Abdulameer Jawad

VIII

102. Relation between Working in Petrol Station and Blood Hemoglobin Levels for the Filling Workers in Al-Najaf City/ Iraq..... 565
Fulath Abdul-Redah Muhsin
103. Effect of Preoperative Breathing Exercise on Postoperative Patients' Lung Functions..... 570
Dhiaa A. Al-Reda, Rajha A. H.
104. Glomerular Diseases: Systemic Lupus Erythematosus is Most Common Finding: A Cross-Sectional Study 576
Fadhil Handhal Khleif, Haider Jebur Kehiosh, Salman Azeez Aljubori, Sabah Nemah Alfatlawi
105. Synthesis of Diimidazole Has Pyrazole, Isoxazole and Pyrimidine Derivatives and Evaluation as Antibacterial 581
Sahar Abdullah Kadham, Abdul Jabar Kh. Atia
106. Novel approach and Cloud Point Extraction Method for Determination of Acetazolamide Drug..... 586
Muna Iskandar Mahdi, Kassim Hassan Kadhim
107. Preparation and Characterization of Nano-Hydroxyapatite Particles and Chitosan by Sol-Gel Method (in Vitro Study)..... 593
Saja Kareem Esmael, Raghdaa Kareem Jassim, Rasha Mahdi
108. Inactivation of Enterococcus Faecalis in Drinking Water using Silver Nanoparticles Embedded Paper..... 600
Alaa H Al-Fatlawi, Shahad A. Raheem
109. Assessment of the Correlation between the Salivary Flow Rate and Dental Caries Experience among Children with β -Thalassemia Major 606
Mudhafar Fadhil Jaddoa, Alhan Ahmed Qasim
110. Determine Effect of Carbothera Therapy on Foot and Leg Ulceration for Diabetic Patients in Endocrine and Diabetic Center at Al-Nasiriya City 612

Abstract

Background: Brachial plexus injury is most commonly caused by motorcycle accidents and leads to a deficit of motor strength, pain and disability of the upper limb. The main purpose of reconstructive action of brachial plexus injury is to restore the function of the shoulder and elbow. **Aim:** This study aimed to compare the clinical function of post-operative nerve grafting with nerve transfer in patients with brachial plexus injury.

Methods: This study enrolled a sample of patients who had surgery and evaluated the range of active movement of shoulder abduction and elbow flexion; motor strength using the scale of the British Medical Research Council (BMRC); neuropathic pain using Visual Analog Scale (VAS); and upper extremity disability using the Quick Disability of the Arm, Shoulder, and Hand (Quick DASH) questionnaire.

Results: 30 patients were divided into groups of nerve grafting and nerve transfer with each group consisting of 15 patients. 13 patients (87%) of each group had motor strength of functional shoulder abduction (>M3) ($p = 0.874$). 13 patients (87%) had better functional elbow flexion motor strength (>M3) in the nerve transfer group than 11 patients (73%) of the nerve grafting group ($p = 0.036$).

Conclusion: The postoperative nerve transferred clinical function showed a better elbow flexion function with a lower severity of upper limb disability.

Keywords: *brachial plexus injury, nerve grafting, nerve transfer.*

Introduction

Brachial plexus injury is a peripheral nerve injury in the upper limb which is often diagnosed and neglected by medical practitioners because of waiting for a functional recovery, resulting in motor and sensory

deficits, accompanied by pain and limitation of limb function which are mutually debilitating. Consequently, it results in a decreased life quality of patients and more negative impacts in terms of psycho-socio-economic¹.

As the number of survivors increases from high-speed motorcycle accidents, the number of brachial plexus injuries also increases. From several epidemiological studies in the United States and Europe, 10-20% of peripheral nerve injuries are brachial plexus injuries with a prevalence of 1.2%, in which 80-90% of such injuries are caused by motor vehicle accidents². Brachial plexus injury is found in the 15-25 year-old male patients³.

The management of brachial plexus injury is still considered a futile attempt by some peripheral neurologists until the 1960s. However, it changes drastically along with the development of physiology

knowledge and peripheral nerve reconstruction techniques. The nerve grafting technique is quite effective in bridging the gap that is too wide after the excision of the nerve segment of the brachial plexus that is damaged and contains fibrotic tissue, compared to the previous action of shortening the collarbone to perform end-to-end coaptation of the neural stump proximal to distal⁴.

Nerve graft acts as a source of the endoneurial tube in which the axonal regeneration occurs. Autogenous nerve graft has another advantage, which is capable of providing a viable source of Schwann cells⁵. Neurotization techniques are published in the form of direct connection of functional donor nerves to the injured recipient nerves. It has provided a major advance in the technique of brachial plexus injury neural reconstruction⁶.

The main purpose of neural reconstruction in brachial plexus injury is to restore clinical function and achieve optimal patients' quality of life⁷. The success of nerve reconstruction with micro surgical techniques should be followed by the assessment of patients' clinical function as postoperative follow-up⁸ both oriented to surgeons such as range of movement (ROM) measurement of joint activation and motor strength recovery, as well as patient-oriented assessment such as neuropathic pain severity and upper limb dysfunction⁹. From that statement, the aim of this study to compare the clinical function of post-operative nerve grafting with nerve transfer in patients with brachial plexus injury¹⁰.

Method

This study used an observational analytic study, with a retrospective cohort design, in which the researchers performed a comparative analysis of current postoperative clinical function in two groups of patients who had performed different surgical actions in the past.

The sample of the study was patients with brachial plexus injury post-operative nerve grafting and nerve transfer, and conducted on January 1, 2009 until September 30, 2014 in Dr. Soetomo Teaching Hospital Surabaya. The sampling technique applied consecutive sampling, in which each patient who fulfilled the inclusion and exclusion criteria was included in the study sample until the required sample number was obtained.

The inclusion criteria were nerve grafting and nerve transfer performed by one operator, the surgery was

conducted minimal and maximum within 9 months after the trauma event, and the clinical function evaluation was conducted at least 6 months after the surgery. On the other hand, the exclusion criteria included brachial plexus injury patients who have performed reconstructive actions other than nerve grafting and nerve transfer (eg. tendon transfer, free functioning muscle transfer, arthrodesis), obstetrical brachial plexus injury and patients who were not willing to participate in the research. The procedure of data collection started from collecting medical record database of inpatient and medical record of Orthopedics and Traumatology Outpatient Dr. Soetomo Teaching Hospital Surabaya to record the population of patients with brachial plexus injury that have been encountered nerve reconstruction. The sample was grouped into two groups, post-operative nerve grafting group and nerve transfer group. Further measurements of postoperative clinical function were conducted by using Data Collection Sheet and QuickDASH questionnaire, either by meeting patients at Orthopedics and Traumatology Outpatient Dr. Soetomo General Hospital or conducted home-visite.

The demographic distribution of sex, age, diagnosis, incidence time to operation (in months), and time difference of surgery until evaluation (in months) was presented using descriptive statistics of mean value, standard deviation, minimum value, maximum value, median or the value of a number in percentage. On the other hand, the normality data test was conducted by using Kolmogorov-Smirnov test. If the data was normally distributed, Independent t-test was applied. However, if the distribution of data was not normal, it assessed by using Mann-Whitney test. The results were statistically significant if $p < 0.05$. The computer program used to perform statistical analysis was SPSS program version 16.0 (SPSS Inc., Chicago, Illinois, USA).

Result

This study used a sample of 15 patients in the nerve grafting group and 15 patients in the nerve transfer group. A total 15 patients (50%) with brachial plexus injury were aged 21-30 years old (7 patients in postoperative nerve grafting group and 8 patients in postoperative nerve transfer group). On the other hand, the second most age range was 11-20 years old of 6 patients (4 patients in postoperative nerve grafting group and 2 patients in postoperative nerve transfer group). The mean age of nerve grafting group was 27.2 years old and the nerve transfer group was 29.93 years old. The

independent t-test was performed because of the normal data distribution with $p = 0.510$.

In sex distribution, brachial plexus patients were dominated by male patients as many as 24 patients (11 in post-operative nerve grafting group and 13 patients in postoperative nerve transfer group). Female patients were 6 patients (4 patients in post-operative nerve grafting group and 2 patients in post-operative nerve transfer group). In nerve grafting group, there were 11 male patients (73.3%) and 4 female patients (26.7%). The nerve transfer group obtained 13 male patients (86.7%) and 2 female patients (13.3%). The gender variable was tested with Fisher’s exact test with $p = 0.651$. There was no significant difference in gender variables.

The diagnosis of patients with major brachial plexus injury was found complete postganglionic type (C5-6-7), preganglionic type (C8-T1) of 15 patients in postoperative nerve grafting group. The rest were

postoperative nerve transfer patients: 9 patients with incomplete upper injury type (C5-6) and 6 patients with incomplete upper injury type (C5-6-7). From 15 patients in nerve grafting group, the patients were complete injury type (100%). The result of Chi-square test was conducted with $p = 0.000$. There was a significant difference. The result of statistical test using independent t-test (normal data distribution) showed that there was no significant difference between the two groups, either from the time incidence until the surgery ($p = 0.052$), and from time difference of surgery until the evaluation ($p = 0.959$). Overall, the sample characteristics between the nerve grafting and nerve transfer group were homogeneous.

The result of ROM comparison of shoulder abduction showed no significant difference between nerve grafting group ($71.33^\circ \pm 32.87^\circ$) and nerve transfer group ($61.67^\circ \pm 34.52^\circ$). The statistical test was conducted by using independent t-test normal with $p = 0.439$. However, in

contrast to elbow flexion ROM results, the nerve transfer group ($102.67^\circ \pm 36.35^\circ$) was better than nerve grafting ($86.67^\circ \pm 48.32^\circ$) (Table 1).

Table 1. Comparison of Post-operative Clinical Functions

Variable	Nerve Grafting (n = 15)	Nerve Transfer (n = 15)	p
Shoulder abduction ROM*	71.330 ± 32.870	61.67 0 ± 34.52 0	0.439
Elbow flexion ROM*	86.670 ± 48.320	102.670 ± 36.350	0.031
Shoulder Abduction Motor (BMRC)**	3(2-4)	3(2-5)	0.0874
Functional Motor M >3***	13 (87%)	13 (87%)	
Elbow Flexion Motor (BMRC)**	3 (1-4)	4 (1-5)	0.036
Functional motor M > 3***	11 (73%)	13 (87%)	
Neuropathic Pain (VAS)**	2 (0-7)	1 (0-3)	0.236

Upper extremity disability (QuickDASH score)*	42.67 ± 21.92	group (24.60±14.83) was lighter than the nerve grafting group (42.67±21.92). The difference was statistically significant, since independent t-test results had p value = 0.014 (p < 0.05) (Table 2).
---	---------------	---

From that table the difference was statistically significant, since the independent t-test result had $p = 0.031$. The minimum motor strength of shoulder abduction on the motor scale of BMRC in the nerve grafting group was M2, the maximum value was M4, and the median value was M3. On the other hand, the nerve transfer group obtained the minimum value of M2, the maximum value of M5, and the median value of M3. To compare the motor strength of shoulder abduction, statistical test was assessed with Mann-Whitney test because the normality test (Kolmogorov-Smirnov test) obtained abnormal data distribution. The results obtained $p = 0.874$, where there was no significant difference between the nerve grafting group and the nerve transfer group. It corresponds to the number of samples with the motor strength of functional shoulder abduction with a value of $>M3$ (useful motor recovery). Between the nerve grafting group and the nerve transfer was the same, i.e. 13 patients each (87%) (on table 1).

The comparison of elbow flexic motor strength showed that nerve transfer group was better than nerve grafting group. The difference was statistically significant since the results of statistical tests with Mann-Whitney test (abnormal data distribution) had $p = 0.036$. This is consistent with the number of samples with functional elbow motor strength with a value of $>M3$ (useful motor recovery) in the nerve transfer group of 13 patients (87%), more than the nerve grafting group of only 11 patients (73%) (Table 2).

Based on the VAS scale in the nerve grafting group, the minimum value was 0, the maximum value was 7 and the median value was 2 (Table 2). The statistical test used was Mann-Whitney test because the distribution of data was not normal with $p = 0.236$. There was no significant difference between nerve grafting with nerve transfer group. The nerve transfer group had greater amount of sample than nerve grafting group in lower VAS scales (8 patients in nerve transfer vs. 6 patients in nerve grafting on VAS 1 scale, and 2 patients in nerve transfer vs. 1 patient in nerve grafting on VAS 0 scale).

The comparison of upper limb disability severity based on the QuickDASH score in the nerve transfer

Discussion

The comparison of elbow flexion ROM in this study was better in nerve transfer group than nerve grafting group. The difference was significant. ROM flexion elbow post operative nerve transfer results obtained better than previous research (Dolan RT, 2012). There was no significant difference between the nerve grafting group and the nerve transfer. This is in accordance with previous studies. Meanwhile, other researchers have published a recovery of motor strength $>M3$ in 80% (total 577 patients) and 73.7% (total 19 patients) post-operative nerve transfer⁷. The significant difference showed that nerve transfer group was better than nerve grafting. It corresponds to the number of samples with a functional elbow flexion motor strength with a value of $>M3$ (useful motor recovery) in the nerve transfer group, more than in the nerve grafting group.

Brachial plexus injury often occurs as a result of trauma resulting in a paralysis of clinical function in the upper limb. Almost 50 years ago, there have been many reconstructive actions in patients with brachial plexus injury¹¹. The main purpose of reconstructive action on brachial plexus injury is to restore clinical function and achieve optimal patients' quality of life⁷.

The success of nerve reconstruction with micro surgical techniques should be followed by assessment of patients' clinical function as postoperative follow-up (surgeon-oriented such as ROM) measurements of joint active and motor strength recovery, or patient-oriented such as the severity assessment of neuropathic pain and upper limb dysfunction⁹. In this study, there was no significant difference in shoulder abduction ROM between the nerve grafting group and nerve transfer group. The results of this study are still better than previous studies, which only obtained shoulder abduction ROM of 57^o¹². Previous studies had better shoulder abduction ROM of postoperative nerve grafting results than this study of 120^o¹³. However, the better shoulder abduction ROM of postoperative nerve transfer result was obtained in previous studies¹⁴.

This result was also supported the operation of elbow flexion function reconstruction. It shows that all samples of nerve grafting group use sural nerve as nerve

graft interposition, whereas nerve transfer group used double-fascicular nerve transfer technique published by Mackinnon. Motor power postoperative nerve transfer may be better than nerve grafting. It may be due to the occurrence of nerve re-innervation to target muscles to travel more closely¹⁵.

The percentage of patients with functional elbow flexion motor restoration with value >M3 postoperative nerve grafting in this study was not much different from previous research results¹¹. While in patients with post-operative nerve transfer, the results of this study is also not much different from the results of research conducted by previous researchers⁷. There was no significant difference between the nerve grafting group and the nerve transfer. However, in the nerve transfer group, it has a larger number of samples at a lower VAS scale than the nerve grafting group.

The results are consistent with previous studies that demonstrate the presence of axons undergoing regeneration via cable nerve graft, resulting in neuropathic pain postoperative nerve grafting. Other results indicate if the mean VAS value decreases postoperative nerve transfer¹⁶. Then, the severity of upper limb disability based on the QuickDASH score in the nerve transfer group is lower than that of nerve grafting, resulting in significant differences. It is similar with the results of previous studies showing a lower mean score post operative nerve transfer¹⁷.

Conclusion

Based on the result of the research, it can be concluded that elbow flexion ROM post-operative nerve transfer is greater than nerve grafting, motor elbow flexion strength post operative nerve transfer is better than nerve grafting and the upper limb disability severity postoperative nerve transfer is lower than nerve grafting.
