## ***Phaleria macrocarpa* (Scheff.) Boerl. Pulp Extract Increases the Sperm Characteristics in *Rattus norvegicus***

**Amaq Fadholly, Arif N. M. Ansori, Annise Proboningrat, Muhammad K. J. Kusala, Naimah Putri, Soeharsono and Budi Utomo<sup>1</sup>**

Department of Veterinary Reproduction, Faculty of Veterinary Medicine, Universitas Airlangga, Surabaya 60115, Indonesia.

(Received : April, 2019 **125/19**

Accepted : May, 2019)

### **Abstract**

Herbal remedy is a type of alternative medicine that originates from plants and have been around for centuries. This study to analyze *Phaleria macrocarpa* L. pulp extract (PMPE) on male fertility by assessing its effect on sperm characteristic including sperm count, motility, viability and membrane integrity. Twenty four males adult of *Rattus norvegicus* were separated into four groups. The treatment of three groups were done orally, once a day with 0.25 ml supplemented for four weeks either with

PMPE at doses 7.5 mg/kg (P1), 15 mg/kg (P2), 30 mg/kg (P4) and CMCNa 0.5% (P0). PMPE significantly increases the percentage of sperm characteristic.

**Key words:** *Phaleria macrocarpa*, motility, viability, membrane integrity

The serious problems that we face today is infertility and about 8-12% of couples suffer from across the globe. Of all infertility cases, approximately 40-50% is due to male factor infertility and as many as 2% of all men exhibit suboptimal sperm parameters (Kumar *et al*, 2015). Among the numerous causes of male

---

<sup>1</sup>Corresponding author: Email : budi-u-2@fkh.unair.ac.id

infertility, oxidative stress (OS) can cause the cellular damage by free radicals that can ultimately impact sperm quality. Free radicals were reported to attack cell metabolites directly, resulting in decreased of ATP levels in sperm cell movement and function (Agarwal *et al.*, 2014).

Medicinal plant offer some advantages for some reason, have been approved globally (Koduru *et al.*, 2007). *Phaleria macrocarpa* L.(PM) is one of the herbal medicine that reported has flavonoids, phenolics and antioxidant properties (Altaf *et al.*, 2013). Some research have published that flavonoids can increase the sperm quality by protecting it from free radicals (Adewoyin *et al.*, 2017). PM was claimed to increase fertility of men but scientific data is not enough yet to prove it. Therefore, the aim of this research is to analyze PMPE on the sperm's quality on *Rattus norvegicus*.

### Materials and Methods

*Phaleria macrocarpa* L. (PM) pulp were collected from Sidoarjo, East Java, Indonesia. 700 g PM pulp slice were cut into small pieces. Slice of PM were dried in a room until 5 days then dried again in oven at 50 °C then powdered using mechanical blender and passed through the coarse sieve (0.2 mm).The PM powder was macerated with ethanol 96% for 72 h at 37 °C. The extract was evaporated in water bath at 60°C. The residue was stored in a refrigerator at -4°C.

Twenty four *Rattus norvegicus* of two months of age and about 250-300 g body weight were used. They were placed in biochemistry laboratory, Faculty of Medicine, Universitas Airlangga at 28-33 °C. The rats were free from disease and deformities. Before treatments they were adapted for a week and fed with pellet and given water *ad libitum*. This study used randomized experimental design with three various doses of PM (7,5 mg/kg (P1), 15 mg/kg (P2). 30 mg/kg (P3)) and control given CMCNa 0,5% (P0). Cervical dislocation was used to kill the rats and the cauda epididymis were removed quickly. The cauda epididymis were cut longi-tudinally with forceps and scissors. Two petri dishes were filled with phosphate buffer saline (PBS) to collect the sperm by mincing the cauda epididymis.

The number and the motility of sperm was found using a haemocytometer in 20 µL solution of the sperm dropped on a cover slip. Using light microscopy, it was counted in 4x4 squares (horizontally or vertically), at 400x magnification. For the viability test, petri dish was prepared with 0,1 M PBS. 20 µL of sperm solution were dropped then mixed with 30 µL of eosin-negrosin and smear with the glass side tip and air-dried.Using light microscopy, the sperm were counted at 400x magnification. While the hos test, 100 µL of sperm were mixed in 900 µL of 60 mOsmol fructose solution. 20 µL were dropped to make smear and then incubated at 37°C for 30 min. Using fluorescence microscopy, the sperms were counted at 400x magnification.

The data was analyzed by using SPSS 21 (SPSS Inc., Chicago, IL), employing one-way analysis of variant (ANOVA) ( $p < 0.05$ ) and followed by Tukey HSD. Tabulated data are presented as the mean  $\pm$  standard deviation.

### Results and Discussion

The sperm count was compared to the total of the sperm in various concentrarions. The highest amount of sperm count was found at P2 (940 million cells/ml), P1 was 810 million cells/ml and when it come to P3 the amount of sperm decreases (710 million cells/ml) compared to P2. The percentage showed no difference between the P0 and P3 significantly, while sperm count in P1 and P2 was significantly different from P0.

The result in fig 1 showed that the highest motility value is found at P2 with mean score of 71.7% compared with P1 of 67.6%.The

Fig 1. Effect of the PMPE on sperm motility of *Rattus norvegicus*.

**Fig 2.** Effect of the PMPE on rat sperm, the untreated group (P0), following group treated 7.5 mg/kg (P1), 15 mg/kg (P2), 30 mg/kg (P3). A) The viability of rat sperm with eosin-negrosin staining. The viable sperm showed colourless head (A) and the dead sperm showed red head (B). B) The membrane integrity of rat sperm with hypo osmotic swelling test. Good sperm with presence of coiled tail (A) and damaged sperm with absence of coiled tail (B). The bars (C,D) represent the mean  $\pm$  SD of viability and membrane integrity percentage.

lowest value showed at P0 of 61.7%, while the concentration of P3 shows decreasing sperm value of 65.9% compared with P2. This increase in sperm motility could be due to the protective effect of PM administration (P1, P2) and increase in total antioxidants capacity.

The result in figure 2(A,C) showed that the highest value is found at P2 with mean score of 72.8% compared to P1 of 68.4%. The lowest value showed at P0 of 62.6%, while P3 showed decreasing sperm value of 67% compared to P2. This increase in sperm motility could be due to the protective effect of PM administration (P1, P2) and increase in total antioxidants capacity. The antioxidants such as flavonoids can provide the protection of the plasma membrane and reduce the excessive amount of ROS in rat sperm (Khaki *et al*, 2011). Antioxidant are substances that can neutralize free radicals in the body and against damage due to free radicals to the cells that have normal conditions. Free radicals were neutralized by antioxidant with supplementing electron deficiencies of chain reactions then

block the occurrence of chain reaction from free radicals formation and due to that the oxidative stress will not perform out of the body (Phanien-dra *et al*, 2015).

The percentage of Hos test showed that the highest value is found at P2 and has the mean score of 73.4% compared to P1 of 68.8%. The lowest value showed at P0 of 62.8% and while P3 showed decreasing sperm value of 67.2% compared to P2. The integrity of membrane of the rat sperm is seen in the fig 2 (B,D). Sperm is wrapped by membrane which serves as a protection against environmental changes. If the sperm is exposed to the hypo osmotic medium, the sperm will swell or curve because the cell membrane is semi permeable and functions normally (Talwar and Hayat-nagarkar, 2015). Meanwhile, P3 have trend in decreasing in all group. Decreasing sperm membrane integrity comes from excess antioxidants. Antioxidants will function if there are pro-oxidants compounds in the body. When the dose of anti-oxidants and pro-oxidants are

not balanced, the body will form pro-oxidants to balance the way then damage the integrity of the sperm plasma membrane and interfere with the function of the mitochondria to produce ATP for movement of sperm (Choudhary *et al.*, 2010) then DNA damage caused by oxidative stress that increases ROS formation, which can damage DNA fragmentation resulting in apoptosis. This results in increase of dead sperm (González-Marin *et al.*, 2012).

Antioxidant activities of PMPE were due to the presence of flavonoids that can increase the viability, motility and membrane integrity of the sperm in the right doses (Jamalan *et al.*, 2016).

### Summary

In conclusion, this study provides the evidence that PMPE can act as antioxidant, enhances the quality of the rats sperm including motility, viability and membrane integrity. PMPE have cytotoxic effect if it was not given in the right doses. We suggest that PMPE could be one of the herbal source for studying on reproduction stage.

## REVISED GUIDELINES TO AUTHORS

1. **THE INDIAN VETERINARY JOURNAL** (Official organ of the Indian Veterinary Association) publishes papers of original work as full papers, clinical articles and short communications on Veterinary, Animal Husbandry and Fishery Sciences. It also serves as a medium of news regarding the veterinary profession and deals with issues of professional importance from time to time through its editorial columns.
2. **Manuscripts are accepted for publication on the clear understanding that :**
  - a) They have neither been published nor been sent for publication elsewhere. All the authors should sign a certificate to this effect in respect of each manuscript sent for publication. Names, qualifications, full addresses and Email ID of all authors must be provided while submitting the manuscripts. Details of the corresponding author with contact phone and the address of the place with PIN code where the work has been carried out must be clearly mentioned.
  - b) The research work has been carried out with the approval of the Institutional Ethics Committee as per the laws in force in the country in which it has been conducted. A certificate to this effect should be signed by all authors. The authors should get written permission from concerned authorities for publishing manuscripts on emerging and exotic diseases.
  - c) All authors are jointly and severally responsible to the various authorities for the contents of the manuscripts. The Editorial Committee shall not be held responsible in any manner whatsoever to the contents of the manuscript and the views and interpretations expressed by the authors in the manuscripts. All disputes regarding any legal proceeding pertaining to the journal shall be within the jurisdiction of the High Court of Judicature at Chennai.
3. **A processing fee of each ` 200/- for Indian and US\$ 20 for foreign manuscript must be sent along with the manuscript in the form of a DD or International Cheque drawn in favour of The Editor, Indian Veterinary Journal, payable at Chennai. Payment of processing fee will not ensure publication of the manuscript. On acceptance of the manuscript for publication, a Publication Charge ( ` 700/- for an Indian manuscript and US\$ 200 for a foreign manuscript) must be sent to The Editor.**
4. **It is mandatory that each Indian author should be a subscriber to the *print or online version* and a foreign author, to the online version of the Journal. The annual subscription fee is ` 700/- for the Indian subscriber and US\$ 200 for the foreign subscriber for the *print or online version* of the Journal.**
5. **Manuscript should be typed in A 4 size paper in double space with 12 pt size Times Roman font as per the Indian Veterinary Journal format. Only two hard copies must be sent to the Editor, Indian Veterinary Journal, 11/7, Pasumpon Muthuramalinga Thevar Road (Chamiers Road), Nandanam, Chennai – 600035, India. Clear prints of figures and photographs in duplicate if any must be sent in glossy print of maxi size. The full postal address with posted pin code of the actual place where the work was carried out, along with the contact phone number of the corresponding author should be provided below the names of author(s) in the articles submitted.**
6. **The decision of the Editor is final in all matters pertaining to the publication of the manuscripts. Editor has the right to do editorial revision of the accepted manuscripts, restriction of number of pages, tables and figures. No reason shall be given for the non-acceptance of the manuscript. Manuscript once received will not be returned to the author under any circumstances. The copy right shall rest with the Journal and no part of any manuscript shall be reproduced without specific permission of the Editor.**
7. **Each manuscript received will be allotted a *Registration Number*. The authors, while sending the revised version of the manuscript based on the comments of the referee, should submit the revised manuscripts in two forms, one hard copy and other one soft copy in CD. This should be as per IVJ format and return the original version along with original comments to the Editor for reference and records. The revised manuscripts should be submitted to the IVJ office within 90 days of receipt, failing which the article will not be considered for publication. A demand letter will be sent to the corresponding author for payments such as processing fee (if not already paid), publication charges and arrears of subscription fees. Only on receipt of full clearance of all the payments and the soft copy in CD, the concerned article will be taken up for publication and the author will be informed accordingly.**
8. **After publication of an article the original / revised copy of the article will be retained at the IVJ office only for a period of 12 months after which the article will be disposed off, since the published version will be available in print and digitized form.**
9. **Indian Veterinary Journal Format:**
  - a) Title; Author(s); Place of work with full address and pin code.
  - b) Full papers: Abstract (not more than 100 words), Keywords (not more than 4 words), Introduction (with no subtitle), Materials and Methods, Results and Discussions, Summary, Acknowledgement (optional) and References (not exceeding 15). The full papers should not exceed 4 printed pages.
  - c) Clinical articles : Abstract (not more than 100 words), Keywords (not more than 4 words), Introduction (with no subtitle), Case History and Observations, Treatment and Discussion, Summary, Acknowledgement (optional) and References (not exceeding 15). The Clinical articles should not exceed 3 printed pages.
  - d) Short Communications: There is no specific format for Short Communication. Articles which do not comply to either Full Papers or Clinical Articles either on quality basis or on page-wise basis will be allotted under Short Communication.
  - e) The page limits are inclusive of figures, photographs and tables.
  - f) All tables should be numbered with upper case roman numerals (I, II...) and all figures should be numbered with arabic numerals (1, 2, 3...).
9. **Citing references: In the text, references should be cited by names of the authors followed by the year of publication in parenthesis. In case of more than two authors, the name of the first author must be followed by *et al*. For the references repeated in the text, the year must be replaced by *loc cit* in successive references. At the end of the text, the references must be furnished in alphabetical order. Each author's name must be followed by initials. Before the name of the last author, the word 'and' must be included. The year of publication must be in parenthesis. The title of the referred article must be given in full. The Journal's name must be in approved abbreviated form and must be in italics. The volume number of the journal must be given in bold letters. It should be followed by a colon and the starting and ending page numbers. While citing books, the Title of the book, Year, Publisher, Place of Publication, Number of the Edition and the relevant page number(s) must be provided. Website, 'in press' and 'personal communication' should be avoided as references.**
10. **All correspondence regarding the status of the articles must be made with The Editor, Indian Veterinary Journal at the Official Address of the Journal.**
