## Message from General Chair

Welcome to SERA 2017. Welcome to London, UK.

The 15th International Conference on Software Engineering Research, Management and Application (SERA 2017) is sponsored by the Institute of Electrical and Electronics Engineers (IEEE) and the International Association for Computer and Information Science (ACIS) in cooperation with The University of Greenwich, London, UK.

The purpose of SERA is to bring together researchers and practitioners from academia, industry, and government to exchange their research ideas and results and to discuss the state of the art in the areas of the conference. In addition, the participants of the conference will have a chance to hear from invited speakers Professor Simon Xu, Department of Computer Science, Algoma University, Canada and Professor Petr Hnetyuka, Associate Professor, Charles University, Prague, Czech Republic.

I would like to thank the Conference Chair Liz Bacon, University of Greenwich, UK; the Program Co-Chairs Jixin Ma, University of Greenwich, UK; and Lachlan Mackinnon, University of Greenwich, UK; the Local Arrangement Co-Chairs Andy Wicks, University of Greenwich, UK; and Yasmine Arafa, University of Greenwich, UK; and the members of the Program Committee for their hard work. And most importantly, we would like to thank all the authors for sharing their ideas and experiences through their outstanding papers contributed to the conference. We hope that SERA 2017 will be successful and enjoyable to all participants.

SERA 2017 Conference General Chair

Roger Lee  
Central Michigan University, USA

June 2017

## Message from Conference Chair

It is my great pleasure to extend a welcome to all of you who are participating in SERA 2017 (the 15th IEEE/ACIS International Conference on Software Engineering, Research, Management & Applications) being held in Greenwich, UK, June 7 to 9, 2017. The conference is sponsored by the IEEE Computer Society and the International Association for Computer and Information Sciences (ACIS), and hosted by the University of Greenwich.

The 15th SERA conference has attracted many researchers from all over the world and given the increasing penetration of software into society, it plays a vitally important role in providing a forum for researchers and practitioners from both academia and industry to exchange and debate ideas on all aspects of Software Engineering research, development, management, and applications, particularly at the interface between practice and theory. The conference keynote will be presented by Prof. Simon Xu from Algoma University, Canada, and Prof. Petr Hnetyuka from Charles University, Czech Republic.

I would like to thank the General Chair, Dr. Roger Lee and Program Co-Chairs Dr. Jixin Ma and Dr. Lachlan Mackinnon and the members of the program committee for their hard work. We hope that you will all enjoy SERA 2017.

SERA 2017 Conference Chair

Liz Bacon  
University of Greenwich, UK

June 2017

## Message from Program Chairs

It is our great pleasure to extend a very warm welcome to all of you who are participating in the 15th IEEE/ACIS International Conference on Software Engineering Research, Management and Applications (SERA 2017) being held in London, the United Kingdom, from June 7 to 9, 2017. The conference is sponsored by the IEEE Computer Society and the International Association for Computer and Information Sciences (ACIS), hosted by University of Greenwich.

The SEAR 2017 conference will bring together researchers, scientists, engineers, industry practitioners, and research students to discuss, encourage and exchange new ideas, research results, and experiences related to all aspects of software engineering research and applications. The conference is structured to cover the complete software lifecycle from design through deployment to maintenance and evolution. In this conference, we will have keynote speeches by Prof. Simon Xu from Algoma University, Canada, and Prof. Petr Hnetynka from Charles University, Czech Republic. We believe that their talks will be fruitful to all of us who are participating in SERA 2017.

We would like to thank the General Chair, Prof. Roger Lee, and the Conference Chair, Prof. Liz Bacon, and the members of the program committee, for their hard work. We hope that SERA 2017 will be successful and enjoyable to all participants.

SERA 2017 Program Co-Chairs

Lachlan Mackinnon, University of Greenwich, the United Kingdom  
Jixin Ma, University of Greenwich, the United Kingdom

June 2017

# Table of Contents

<b>Keynote</b>	<b>1</b>
Empirical Research Methods for Software Engineering <i>Simon Xu</i> .....	1
Software Abstractions and Architectures for Smart Cyber-Physical Systems <i>Petr Hnetynka</i> .....	3
<b>Analysis and Design of Algorithms / Program</b>	<b>5</b>
A Confidentiality Preserving Publicly Verifiable Computation for Multivariate Polynomials <i>Jiameng Sun, Binrui Zhu, Jing Qin, Jixin Ma</i> .....	5
<b>Business Process Engineering</b>	<b>13</b>
A Server Selection Strategy about Cloud Workflow based on QoS Constraint <i>Futian Wang, Ke Fang, Jin Tang, Cheng Zhang</i> .....	13
<b>Communication Systems and Networks</b>	<b>19</b>
A Bisectional Multivariate Quadratic Equation System for RFID Anti-Counterfeiting <i>Xiaoyi Zhou, Xiaoming Yao, Honglei Li, Jixin Ma</i> .....	19
Remote Sensing of Damage Bridge Structure of Free Vibration by Using Finite Element Method Based on Jerk-Energy <i>Bouyahi Mohamed, Ezzedine Tahar, Rezig Houria</i> .....	25
Efficient Composite Event Detection Based on DHT Protocol <i>Amina Chaâbane, Salma Bradai, Wassef Louati, Mohamed Jmaiel</i> .....	31
<b>Data Mining and Knowledge Recovery</b>	<b>39</b>
Modern Predictive Models for Modeling the College Graduation Rates <i>Emma A. Gunu, Carl Lee, Wilson K. Gyasi, Robert M. Roe</i> .....	39
Enterprise Map Construction based on EOLN model <i>Qiwen Zhang, Yunchan Sun, Rongfang Bie</i> .....	47
Generation of Reducts and Threshold Functions Using Discernibility and Indiscernibility Matrices <i>Naohiro Ishii, Ipppei Torii, Kazunori Iwata, Kazuya Odagiri, Toyoshiro Nakashima</i> .....	55
LogSumExp for Unlabeled Data Processing <i>Taocheng Hu, Jinhui Yu</i> .....	63
<b>Design and Process Engineering</b>	<b>71</b>
The Analysis and Prediction of Customer Review Rating Using Opinion Mining <i>Wararat Songpan</i> .....	71
Sentiment Analysis on Social Media Using Morphological Sentence Pattern Model <i>Youngsub Han, Kwangmi Ko Kim</i> .....	79
<b>Healthcare Information Engineering</b>	<b>85</b>
On Blockchain-Based Anonymized Dataset Distribution Platform <i>Shinsaku Kiyomoto, Mohammad Shahriar Rahman, Anirban Basu</i> .....	85
A Smart Health Service Model For Elders Based On ECA-S Rules <i>Shujie Hu, Mengxing Huang, Wenlong Feng, Yu Zhang</i> .....	93
An Analysis of the Health Care Platform in the Cloud Environment <i>Honglei Li, Qi Chen, Xiaoyi Zhou</i> .....	99

The Impacts of Consumer’s Health Topic Familiarity in Seeking Health Information Online <i>Ira Puspitasari</i> .....	103
<b>Image Processing</b> .....	<b>111</b>
Manifold Ranking Weighted Local Maximal Occurrence Descriptor for Person Re-identification <i>Foqin Wang, Xuehan Zhang, Jixin Ma, Jin Tang, Aihua Zheng</i> .....	111
Salient Object based Action Recognition using Histogram of Changing Edge Orientation (HCEO) <i>Hnin Mya Aye, Sai Maung Maung Zaw</i> .....	115
Automatic Facial Expression Recognition Based on a Deep Convolutional-Neural-Network Structure <i>Ke Shan, Junqi Guo, Wenwan You, Di Lu, Rongfang Bie</i> .....	123
Feature Based Disparity Estimation Using Hill-Climbing Algorithm <i>Tin Tin San, Nu War</i> .....	129
An Encrypted Medical Image Retrieval Algorithm Based on DWT-DCT Frequency Domain <i>Chunyan Zhang, Jingbing Li, Shuangshuang Wang, Zhaohui Wang</i> .....	135
A Robust Algorithm of Encrypted Medical Volume Data Retrieval Based on 3D DWT and 3D DFT <i>Shuangshuang Wang, Jingbing Li, Chunyan Zhang, Jintao Liang, Zhaohui Wang</i> .....	143
A New Graph Ranking Model for Image Saliency Detection Problem <i>Yuan Yuan Guan, Bo Jiang, Yun Xiao, Jin Tang, Bin Luo</i> .....	151
Gabor-Feature-Based Local Generic Representation for Face Recognition with Single Sample per Person <i>Taher Khadhraoui, Faouzi Benzarti, Hamid Amiri</i> .....	157
Image Mosaicking for Oversized Documents with a Multi-Camera Rig <i>Zhen Wang, Feilin Han, Weidong Geng</i> .....	161
<b>Information Assurance</b> .....	<b>169</b>
An Improved Information Hiding Algorithm based on Image <i>Ziqian Yuan, Zijie Guan, Hao Feng</i> .....	169
<b>Mobile / Wireless Computing</b> .....	<b>173</b>
Detection and Mitigation of Wireless Link Layer Attacks <i>May Aye Chan Aung, Khin Phyo Thant</i> .....	173
<b>Model Driven Architecture</b> .....	<b>179</b>
Model Driven Development of Mobile Applications Using Drools Knowledge-based Rule <i>Ei Ei Thu, Nwe Nwe</i> .....	179
<b>Object-Oriented Technology</b> .....	<b>187</b>
Reusable Components For Adding Multi-Tenancy to Legacy Applications <i>Uwe Hohenstein, Preeti Koka</i> .....	187
<b>Parallel and Distributed Computing</b> .....	<b>195</b>
CloudSim4DWf: A CloudSim-Extension for Simulating Dynamic Workflows in a Cloud environment <i>Fairouz Fakhfakh, Hatem Hadj Kacem, Ahmed Hadj Kacem</i> .....	195
<b>Reliability Modeling and Analysis</b> .....	<b>203</b>
A Reliability Evaluation Model of Distributed Autonomous Robotic System Architectures <i>Xin He, Changbin Xue, Qing Zhou, Kexin Lin</i> .....	203
Application of Support Vector Machine with Simulated Annealing Algorithm in MBR Membrane Pollution Prediction <i>Chunqing Li, Yingxin Tao</i> .....	211

<b>Reverse Engineering, Reengineering</b>	<b>219</b>
On the Use of Visual Clustering to Identify Landmarks in Code Navigation <i>Sandeep Reddivari, Mahesh Koapalli</i> .....	219
<b>Software Engineering</b>	<b>229</b>
Coordination Support for Integrating User Centered Design in Distributed Agile Projects <i>Ohoud Almughram, Sultan Alyahya</i> .....	229
Visualization of Online Datasets <i>Christopher Johnston Downie, Taoxin Peng</i> .....	239
Curricular Change Management with Git and Drupal <i>Abhishek Turkey, Kevin A. Gary</i> .....	247
An Empirical Investigation of the Software Integration Success Factors in GSD Environment <i>Muhammad Ilyas, Siffat Ullah Khan</i> .....	255
<b>Software Performance Prediction</b>	<b>263</b>
Software Performance Prediction at Source Level <i>Erh-Wen Hu, Bogong Su, Jian Wang</i> .....	263
<b>Software Reuse and Metrics</b>	<b>271</b>
An Automated Code Smell and Anti-Pattern Detection Approach <i>Sevilay Velioğlu, Yunus Emre Selçuk</i> .....	271
A Framework of Software Reusing Engineering Management <i>Xin TAO, Yang LIU</i> .....	277
Policy Enforcement upon Software Based on Microservice Architecture <i>Tugrul Asik, Yunus Emre Selcuk</i> .....	283
Identifying and Localizing the Inter-Consistency Errors Among UML Use Cases and Activity Diagrams: An Approach Based on Functional and Structural Size Measurements <i>Hela Hakim, Asma Sellami, Hanène Ben-Abdallah</i> .....	289
<b>Software Testing</b>	<b>297</b>
Effects of FSM Minimization Techniques on Number of Test Paths in Mobile Applications MBT <i>Maiada M. Shabaan, Haitham S. Hamza, Yasser M. K. Omar</i> .....	297
<b>Data Analytics and Applications</b>	<b>303</b>
Research on the Construction of Semantic Dictionary in the Football Field <i>Jiguang Wu, Ying Li</i> .....	303
Data Analysis with Multi-objective Optimization Algorithm: a Study in Smart Traffic Signal System <i>Pengzhe Zhou, Zhiyi Fang, Hongliang Dong, Jiayue Liu, Shuaining Pan</i> .....	307
Data Structure and Triangulation Algorithm for Non-Uniform Landscapes <i>Yasunori Shiono, Takaaki Goto, Kensei Tsuchida</i> .....	311
Predicting Gross Domestic Product Using Autoregressive Models <i>John Roush, Keith Siopes, Gongzhu Hu</i> .....	317
Study and Realization of a CRM System in Fuxin Bank <i>Qingxing Guo, Zhendong Xie, Xi Ning</i> .....	323
Specifying Architecture of Knowledge Graph with Data Graph, Information Graph, Knowledge Graph and Wisdom Graph <i>Yucong Duan, Lixu Shao, Gongzhu Hu, Zhangbing Zhou, Quan Zou, Zhaoxin Lin</i> .....	327
A stochastic revelation on the deterministic morphological change of $3x+1$ <i>Yucong Duan</i> .....	333

Bidirectional Value Driven Design between Economical Planning and Technical Implementation Based on Data Graph, Information Graph and Knowledge Graph <i>Lixu Shao, Yucong Duan, Xiaoning Sun, Quan Zou, Rongqi Jing, Jiami Lin</i> .....	339
Research on Service Recommendation Reliability in Mobile Computing <i>Weng Wen, Huaikou Miao</i> .....	345
On the Estimation of Time Series Data of Daily Life <i>Teruhisa Hochin, Hiroki Nomiya</i> .....	351
Analysis of Perception of People to School Mottos <i>Rieko Fujita, Tokuro Matsuo, Teruhisa Hochin</i> .....	357
Analysis of Road Traffic Fatal Accidents Using Data Mining Techniques <i>Liling Li, Sharad Shrestha, Gongzhu Hu</i> .....	363

# The Impacts of Consumer's Health Topic Familiarity in Seeking Health Information Online

A Solution Based on Consumer's Perspective in Health Information Search

Ira Puspitasari

Information System Study Program  
Faculty of Science and Technology, Universitas Airlangga  
Surabaya, Indonesia  
ira-p@fst.unair.ac.id

**Abstract**—Consumers or non-medical professionals are progressively going online to seek health information. Despite the increasing number of health information search online, acquiring the correct and relevant information based on consumer's understanding remains a problem. The information retrieved from the Internet may not fit consumer's understanding because the consumer's familiarity with health topic varies.

To improve the accuracy of health information search results, this paper investigates the impact of consumer's familiarity on the search behaviour using language models approach. A user experiment was conducted with 60 participants searching on the topic tasks of dengue fever, diabetes mellitus, and gastroesophageal reflux disease. The participants also rated their familiarity with health task topics on the scale of 1 (not familiar at all) to 4 (familiar). This rating categorized the participants into four familiarity groups (F1, F2, F3, and F4). The data analysis involved the transcription of search task data into the sequence of search activities to identify unique search activity patterns between familiarity groups.

The results showed that the familiarity with health topics affected health information search behaviour. There were unique search patterns exhibited by groups of participants with different familiarity. In the query stage, participants with less familiarity issued more modified queries than the participants with higher familiarity. In the decision stage, familiar participants were likely to achieve higher search efficacy than less familiar participants. When locating the potential relevant search result, participants in the higher familiarity groups tended to be more successful than the participants in the lower familiarity groups. By analysing the search behaviour, health information search systems could predict the consumer's familiarity to present more relevant and understandable results.

**Keywords**—health information search; familiarity with health topic; search activity; sequence of search activities

## I. INTRODUCTION

The growing numbers of consumer health informatics researches have changed the way the consumers engage with health information. The use of Internet-derived health information is rapidly increasing. Among the contributing factors are the growing awareness of the need to equalize relationships between healthcare professionals and lay people [1], the increasing awareness to be more proactive and

responsible for own and families health [2], and the pressure costs of healthcare system.

A number of consumer-centric health systems have been built to facilitate the rapid use of health information searches on the Internet, such as Health Information Query Assistant [3], Consumer Health Vocabularies initiatives [4], SimpleMed and MeshMed [5], and MedSearch [6]. Despite the increasing customer-centric effort, searching for health information remains difficult for most consumers. Most people are not familiar with medical terminology and understand some health terminologies differently with medical professionals. For example, a heart attack often mistakenly as the heart does not beat according to lay people, while to the doctor, a heart attack means there is damage to the heart muscle. The consumer's familiarity with health topic also varies. A person may be knowledgeable about tropical diseases, but not familiar with mental diseases, while another person may have the opposite familiarity. The terminology *dengue fever* (ICD-10-CM A90) is more familiar in Asian and Latin America countries because of its frequent occurrences in those regions [7]. This familiarity diversity may cause serious impacts since the information presented does not match the consumer's familiarity.

Most studies of health information seeking by consumers focus on building the bridge between consumers and medical professionals. To improve the quality of health information search, providing a *non-intrusive personalization* based on consumer's familiarity is necessary. The aim of this paper is to do the initial step in developing more accurate and less intrusive personalization, i.e., examining how familiarity with health topic influences health information searches. The identification of specific behaviours between unfamiliar and familiar consumers enables a non-intrusive familiarity prediction during a health information search session.

## II. RESEARCH DESIGN

### A. Data Collection

In this study, the preliminary data collection was gathered from 60 participants. The criteria of the recruited participant are adult (age  $\geq 18$  years), non-medical professionals, the ability to write and read, basic skill in computer and Internet operation, and experiences in health information seeking on the Internet. The data was collected from transaction logs, history

of Internet browsing, interviews, and screen and audio recording.

The 24 women and 36 men ranged in age between 21 to 45 participated in this study. The majority of the participants had a university-level education (52), mainly at the bachelor (30), or master (18) degree. The profile of the participants were students, faculties, researchers, administration staffs, and civil servants. Most of the students and faculties were from science and engineering, and information system department. All participants had been using the Internet for three or more years and had experience in health information seeking on the Internet. Most of the participants sought health information online as the need arise, mainly to look for information about a specific disease, certain medical treatment, and diet and nutrition.

TABLE I EXAMPLE OF HEALTH SEARCH TASK: TASK 1 (ENGLISH)

<b>Health Topic: Dengue fever</b>			
<b>Task 1</b>			
Your sister has been suffering a high fever and muscle pain for the last three days. You also noticed the appearance of rashes and purplish spots on her skin.			
The doctor diagnosed her with <i>dengue fever</i> and advised hospitalization for a comprehensive treatment.			
You want to know how a person can get a dengue fever, the likelihood of dengue fever can be life-threatening, and the treatment for dengue fever.			
<b>Pre-search familiarity self-assessment</b>			
Please rate your familiarity with the search task topic.			
<input type="checkbox"/>	1	Never heard of it before.	
<input type="checkbox"/>	2	Slightly familiar, I am not familiar with this topic, but I have heard this topic somewhere.	
<input type="checkbox"/>	3	Somewhat familiar, I know a little about this topic.	
<input type="checkbox"/>	4	Familiar, I know this topic well.	
<b>Your Answer:</b>			
.....			
.....			
.....			
How would you rate the cognitive effort required to complete this task?			
<input type="checkbox"/>	1	<input type="checkbox"/>	2
<input type="checkbox"/>	3	<input type="checkbox"/>	4
<input type="checkbox"/>	5		
very large			very small
amount			amount
How would you rate the difficulty of this task?			
<input type="checkbox"/>	1	<input type="checkbox"/>	2
<input type="checkbox"/>	3	<input type="checkbox"/>	4
<input type="checkbox"/>	5		
very difficult			very easy
Please explain your general strategy to finish this task.			
.....			
.....			
.....			

The instruments for data collection were written in English and Bahasa Indonesia. The instruments comprised of demographic profile survey, pre-search familiarity self-assessment, and health information search tasks. The search task consisted of three tasks, task 1 discussed dengue fever, one of the diseases that has grown dramatically around the world in recent decades [7]; task 2 was diabetes mellitus, one of the top 10 causes of death in 2015 [8]; and the topic for task 3 was gastroesophageal reflux disease (GERD). Table 1 presents an example of a complete health search task instrument in the data collection.

The participant completed a data collection in the following procedure:

1. Profile survey: the participant completed user profiles and health information search experiences.
2. Pre-search familiarity self-assessment: the participant was given time to read the search task scenarios carefully for 30 minutes. The participant rated the familiarity with the topic in each task based on his/her understanding on the scale of 1 (not familiar at all) to 4 (familiar).
3. Health information search task session: the participant was instructed to perform the search task one by one. The participant was free to use any search engine, website, or health information system at their own speed. All of the search session was screen recorded using CamStudio software [9]. After finished each search task, the participants provided comments about their perceptions on completing the task.

*B. Data Analysis*

The data collected from each participant consisted of profile data, a self-assessment of familiarity with health topic, and a video recording during the search session. Each participant produced three data instances, one for each task. The profile data captured the demographic characteristics of the participant. The self-assessment familiarity categorized participants into four familiarity groups, i.e., F1 (not familiar at all), F2 (slightly familiar), F3 (somewhat familiar), and F4 (familiar). The video data were used to examine how the participants completed the search task based on their familiarity with the health topic. Only the search session including the finding of the relevant answer that was transcribed further.

The video data of each search session was transcribed into a sequence of search activities. We developed the search activity coding scheme to transcribe the video based on the work in [10] and [11]. The coding scheme consists of three stages and fifteen activity types, as listed in Table II. An example portion of the transcription results is: “Q3-E1-E3-E3-E5-D1-E5-D3”. Based on the sequence, the participant started the search session by accessing a general search engine to construct a new query, examined the results retrieved, and selected two potential relevant results from health / medical websites. Subsequently, the participant evaluated the first selected articles and marked it as relevant. The last E5 and D3

showed that the participant evaluated the second article and marked it as not relevant.

TABLE II CODING SCHEME

Coding Scheme	Description
<b>Stage 1: Query</b>	
<b>Q1</b>	<ul style="list-style-type: none"> <li>Access and browse health/medical websites (e.g., consumer health informatics, health agency website, health specific search engine, medical dictionary),</li> <li>Submit a new query about a new/different health topic.</li> </ul>
<b>Q2</b>	<ul style="list-style-type: none"> <li>Access and browse health/medical websites (e.g., consumer health informatics, health agency website, health specific search engine, medical dictionary),</li> <li>Modify previous query by making it more general or more specific.</li> </ul>

### C. Identifying Search Activity Pattern

To examine how the familiarity with health topic influences search behaviour, the next step in the data analysis was identifying common search activity using n-gram language models. The method to discover the pattern followed the method in [11] and [12]:

1. Transforming the sequence of search activities into n-gram language models. Each dataset was divided into 80% training data and 20% test data. The language models composed of 2-grams to 6-grams models. Given a user search session “Q1-E1-E3-E3-E5-D1-E5”, the trigram represented three search activities consecutively,

i.e., “Q1-E1-E3”, “E1-E3-E3”, “E3-E3-E5”, and “E3-E5-D1”. In the sequence “Q1-E1-E3”, the likelihood of being in the state E3 depends on having been in state Q1 and E1 previously.

2. Evaluating the perplexity [13] of each language model. The perplexity  $PP(p_M)$  of a language model  $p_M$  (next word  $w$ |history  $h$ ) on a test set  $T=\{w_1, \dots, w_t\}$  was computed using the following formulation:

$$PP_T(p_M) = \frac{1}{\left(\prod_{i=1}^t p_M(w_i|w_1 \dots w_{i-1})\right)^{\frac{1}{t}}}$$

The model with the lowest perplexity was selected as the number of search activities in a sequence that best represented the search pattern.

3. Applying the selected n-gram to the search activities data to identify common patterns in each familiarity group.

## III. RESULTS

### A. Familiarity with Health Topic

The participants rated their familiarity with health topic for each task, as shown in Table III.

TABLE III FAMILIARITY SELF-ASSESSMENT RESULT

Task	Topic	Familiarity				Participants, n
		F1	F2	F3	F4	
1	Dengue fever	11	11	21	17	60
2	Diabetes mellitus	12	26	13	9	60
3	Gastroesophageal reflux disease (GERD)	27	15	11	7	60
	Total	50	52	45	33	180

The most recognizable health topic was dengue fever. All participants who rated their familiarity as F3 or F4 had developed an awareness of dengue fever since child age due to its prevalence in their surroundings. The most unrecognizable health topic in this study was GERD. The pre-search familiarity results in Table III also demonstrated that each participant was familiar with different health topics. A participant in this study was familiar with dengue fever and diabetes mellitus, but he/she was unknown to GERD. While another participant had experienced diabetes mellitus and GERD, but he/she had never of about dengue fever before.

### B. Search Activity

All participants managed to find the correct answer to the questions in health search task. Thus, all search sessions were transcribed using the coding scheme in Table II. The transcription produced 180 sequences of search activities (1 sequence of search activities for each search session) and 4605 search activities. The longest and the shortest sequence in a search session contained 212 and 5 activities respectively. On average, a health information search session contained 25.1 search activities (SD 20.76). The composition of each search activity in each familiarity group is shown in Table IV.

The most frequent search activity performed by all participants was visiting and evaluating the selected item from the search result to assess its relevance (E5). On average, each familiarity group produced 284.25 (24.69%) E1 activity. The second and the third most frequent search activities in group F1 and F2 were evaluating the result retrieved from the search engine (E1) and selecting an article from a health website (E3). On the contrary, the second and the third most frequent search activities in group F3 and F4 were selecting an article from a health website (E3) and evaluating the result retrieved from the search engine (E1). In terms of assessing the selected item from a health website, group F1 encountered irrelevant article (D3) more frequent than relevant article (D1). In contrast, the other three groups discovered relevant article more often than irrelevant article. In the query stage, participants in group F1 and F2 modified the query more frequent than those in group F3 and F4.

TABLE IV PROPORTION OF SEARCH ACTIVITY IN EACH FAMILIARITY GROUP

F1		F2		F3		F4	
Type	%	Type	%	Type	%	Type	%

### C. Health Information Search Pattern

A search activity pattern captures the behavioural tendency of health information search in each familiarity group. The first step in identifying the pattern in this study was determining the pattern size. We used n-gram language model and perplexity evaluation to determine the number of search activities in a sequence that best represented the behavioural pattern.

Figure 1 shows the perplexity evaluations of all language models. According to the result, 5-gram language model had the lowest perplexity in all datasets, thus we used 5-gram sequences to identify the prevalent pattern in each familiarity group. There were 978, 548, 428, and 521 5-gram sequences types in group F1, F2, F3, and F4 respectively. In the analysis, only the 20 most frequent 5-gram sequences were examined further because the numbers of 5-gram sequences above top 20 were too small to be considered as common occurrences.

To identify the common pattern in each familiarity group, we categorized 5-gram sequences data into six clusters. The categorization is as follows: 1) Cluster 1 comprised issuing a new or modified query, examining the retrieved results, and selecting an article from a health website or general website, and evaluating its relevance; 2) Cluster 2 comprised examining the retrieved results, selecting multiple articles from the search results, and evaluating the articles' relevance one by one; 3) Cluster 3 included finding a relevant article in the results retrieved from the first query; 4) Cluster 4 included finding a relevant article in the results retrieved from the modified query; 5) Cluster 5 consisted of continuing the search process after finding a relevant article by examining the previous search results; 6) Cluster 6 consisted of continuing the search process after finding a relevant article by issuing a new or a modified query. Table V shows the frequent search patterns in each familiarity group based on the cluster categorization.

#### IV. DISCUSSION

##### A. Search Activity in Each Familiarity Group

All participants allocated significant efforts in the evaluation stage by visiting and evaluating the selected item to assess its relevance, evaluating the search result retrieved from the search engine, and selecting a retrieved item from a health/medical website. Most participants also used general

search engines (such as Google and Bing) to start a health information search session. These findings show that most non-medical professionals are not accustomed to health information search.

In the query stage, participants in the less familiar groups issued more modified queries than the participants in the higher familiarity groups. A participant in group L1 submitted six queries to answer the question in Task 3, i.e., “GERD”, “what is GERD”, “heartburn”, “burning sensation in your chest”,

“GERD burning sensation”, and “how to treat GERD”. Another participant in Group F2 issued five queries in Task 2, i.e., “what is diabetes mellitus”, “diabetes mellitus symptoms”, “sugar diet”, “diabetes medicine”, and “differences between type 1 and type 2 diabetes”. The query submitted by participants in group F1 and F2 contained more keywords from the task description than the query submitted in group F3 and F4. These indicate that less familiar participants encountered more difficulties in the query formulation. In terms of the selection of search engines, most participants in all groups opted general search engine to start the search session. Some participants in group F4 directly accessed consumer health websites to seek health information. Knowledgeable users targeted more appropriate resources to increase the search efficacy.

In the decision stage, participants in the higher familiarity groups were likely to achieve higher search efficacy than less familiar participants. Search efficacy measured the number of relevant assessment (D1 and D2) against the number of items visited (E3, E4, E6, and E7) in a search session. Group F4 accomplished the highest efficacy of 56.14% compared with 27.00%, 43.27%, and 46.64% for group F1, F2, and F3 respectively. Based on the results in Table III, participants in group F1 found more irrelevant articles than the relevant articles. In the other three groups, the proportion of D1 (relevant item from a health/medical website) was higher in the more familiar groups.

#### B. The Impact of Familiarity with Health Topic on Search Pattern

The participants in different familiarity groups exhibited specific behaviours in health information search. In cluster 1, all groups issued new or modified queries, examined the retrieved results, accessed items from health website, and evaluated the item’s relevance. A frequent 5-gram sequence in group F1 was modifying the query after discarding the previously retrieved result without accessing any article. In term of the query type, all 5-gram sequences in group F1 composed only modified query submissions to a general search engine. Cluster 1 in group F2 and F3 included new and modified query submission to a general search engine. On the other hand, cluster 1 in group F4 consisted of new and modified query submissions to a general search engine and new query submissions to a consumer health informatics. The search engine selection in group F4 demonstrated that knowledgeable users targeted more appropriate resources to increase the search efficacy. This finding is in line with the previous study that reported more familiar participants achieved better search efficiency than the less familiar participants [14].

A search strategy of finding the potential relevant items is selecting multiple items from the results retrieved and evaluating the items one by one. This strategy was performed by participants in group F2, F3, and F4. The participants in groups F1, who had never heard of the health topic before, tended to select an item and evaluate the item immediately. These unfamiliar searchers need to construct their understanding with health topic definition first before they can select another potential relevant article.

When locating the potential relevant search result, participants in the higher familiarity groups tend to be more successful than the participants in the lower familiarity groups. Previous work in [11] also reported the similar finding. Cluster 3 and cluster 4 demonstrate this tendency. Participants in group F4 had the highest proportion of finding the relevant article in the results retrieved from the first query than the other groups. Group F1 discovered the relevant article in the results retrieved only from the modified query. While group F2 and F3 located relevant articles in the retrieved results from the modified query more frequent than from the first query.

Most participants in all groups continued the search session after they discovered a relevant article. Participants in group F1 continued the search process by issuing another query, while participants in other groups proceeded the search session by reexamining the last retrieved results and issuing another query. They continued the search process to verify the correctness of the information they discovered and to resolve their incertitude about an unfamiliar health topic. These activities demonstrate that participants are likely to be more cautious in health information search.

## V. CONCLUSION

This study investigates an emerging important issue in health information search, i.e., individual health topic familiarity. The consumer’s behaviour in health information search can be examined using language models approach. The results of this study affirm the impacts of familiarity with health topic on search behaviour in health information searches. Each familiarity group in this study exhibits unique search patterns.

Delivering health information that matches the user’s familiarity is crucial since misunderstanding in health information may lead to fatal consequences. By analysing the consumer’s search behaviour, a health information search system could predict the consumer’s familiarity to present more relevant and understandable results and to improve the overall health information search experience

## The impacts of consumer's health topic familiarity in seeking health information online (Conference Paper)

Puspitasari, I.  

Information System Study Program, Faculty of Science and Technology, Universitas Airlangga, Surabaya, Indonesia

### Abstract

[View references \(14\)](#)

Consumers or non-medical professionals are progressively going online to seek health information. Despite the increasing number of health information search online, acquiring the correct and relevant information based on consumer's understanding remains a problem. The information retrieved from the Internet may not fit consumer's understanding because the consumer's familiarity with health topic varies. To improve the accuracy of health information search results, this paper investigates the impact of consumer's familiarity on the search behaviour using language models approach. A user experiment was conducted with 60 participants searching on the topic tasks of dengue fever, diabetes mellitus, and gastroesophageal reflux disease. The participants also rated their familiarity with health task topics on the scale of 1 (not familiar at all) to 4 (familiar). This rating categorized the participants into four familiarity groups (F1, F2, F3, and F4). The data analysis involved the transcription of search task data into the sequence of search activities to identify unique search activity patterns between familiarity groups. The results showed that the familiarity with health topics affected health information search behaviour. There were unique search patterns exhibited by groups of participants with different familiarity. In the query stage, participants with less familiarity issued more modified queries than the participants with higher familiarity. In the decision stage, familiar participants were likely to achieve higher search efficacy than less familiar participants. When locating the potential relevant search result, participants in the higher familiarity groups tended to be more successful than the participants in the lower familiarity groups. By analysing the search behaviour, health information search systems could predict the consumer's familiarity to present more relevant and understandable results.
