

CHAPTER III

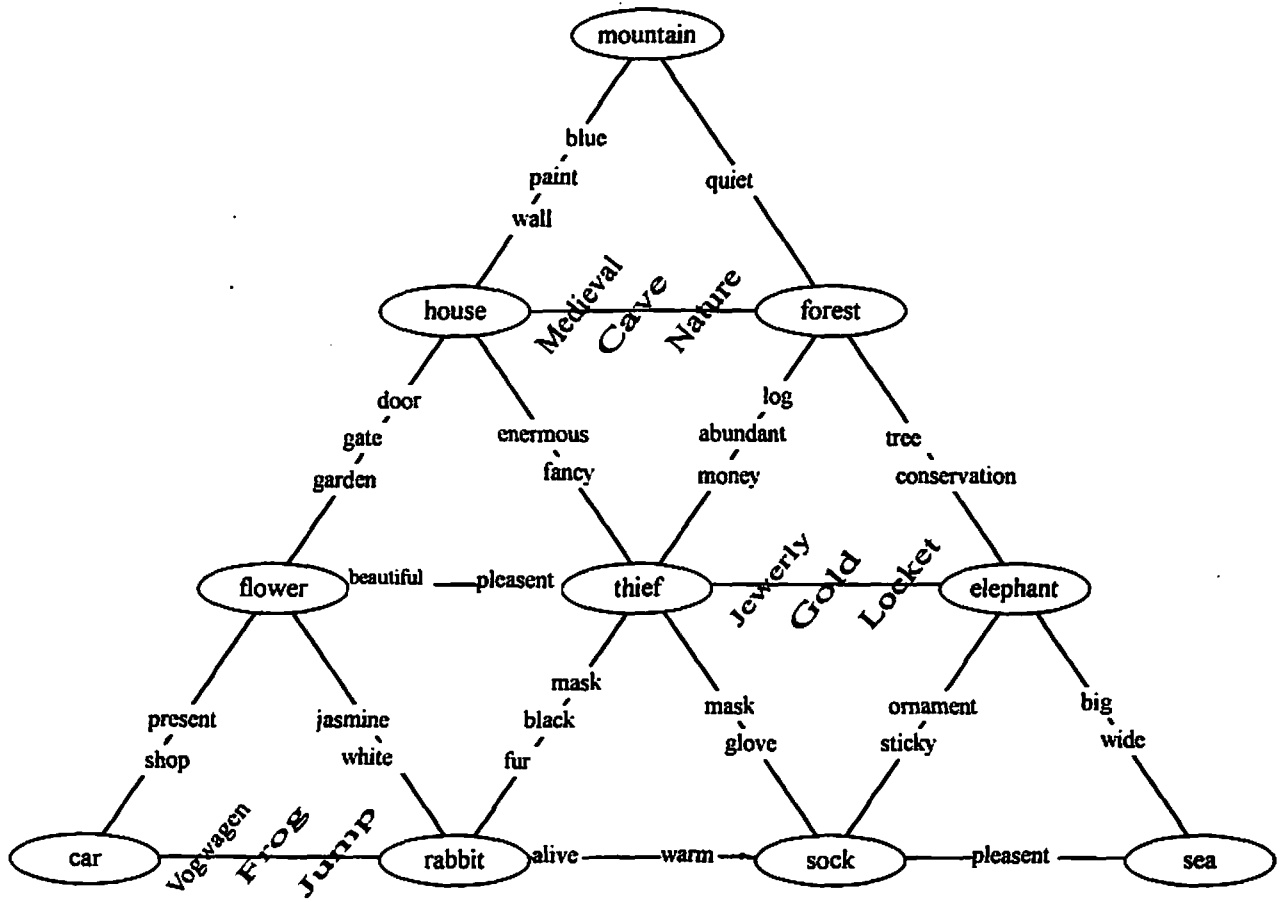

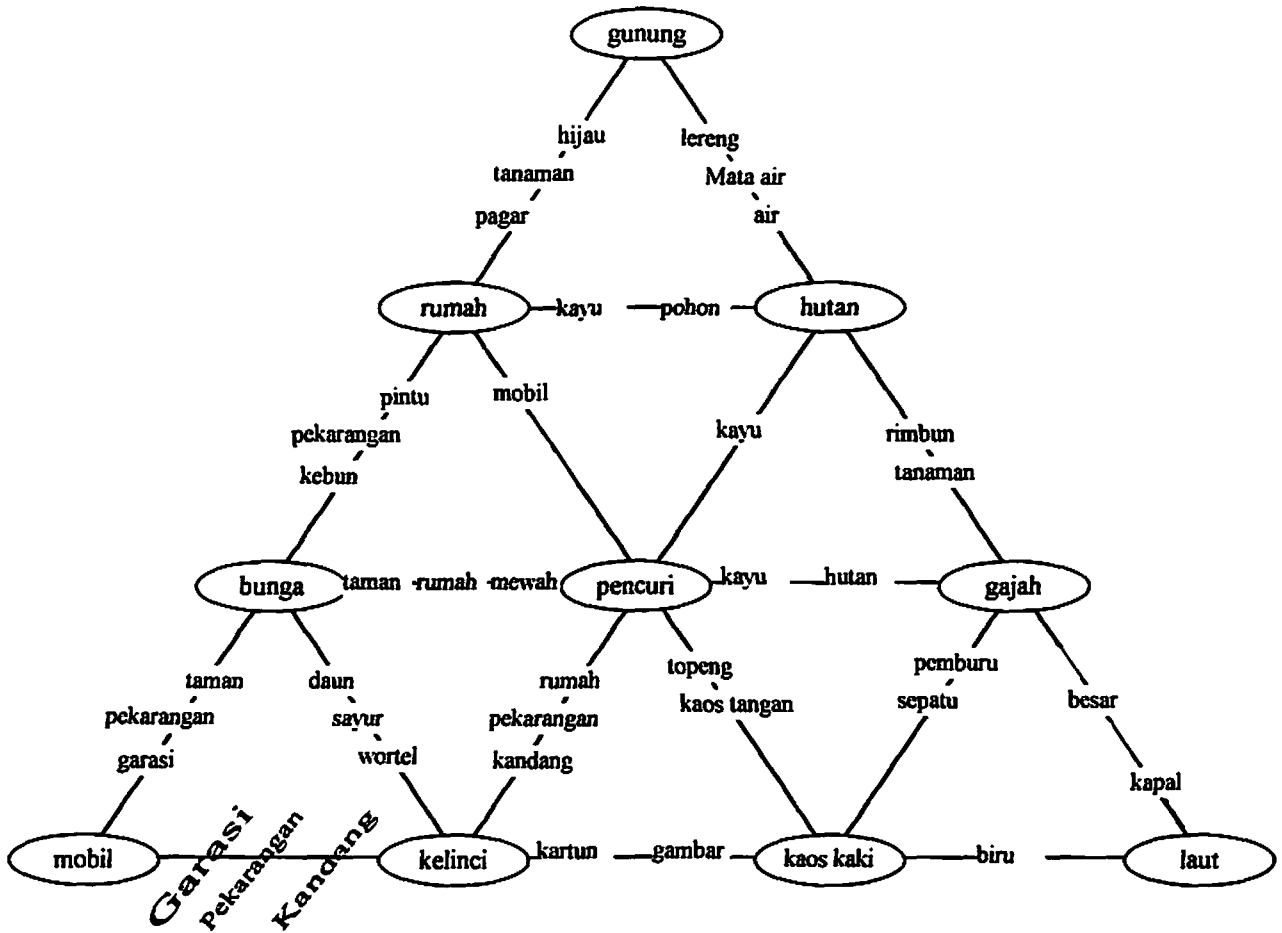

PRESENTATION OF THE DATA

The outcomes of the data collection are the association chains, which were constructed by the respondents in the model test papers. There are two versions of model test papers: the Indonesian and the English versions. Each version consists of 18 association chains. The writer presents these association chains into a configuration of four-level hierarchical semantic network structure. Hence, the semantic network structure falls into two versions: the Indonesian and the English semantic network structures.

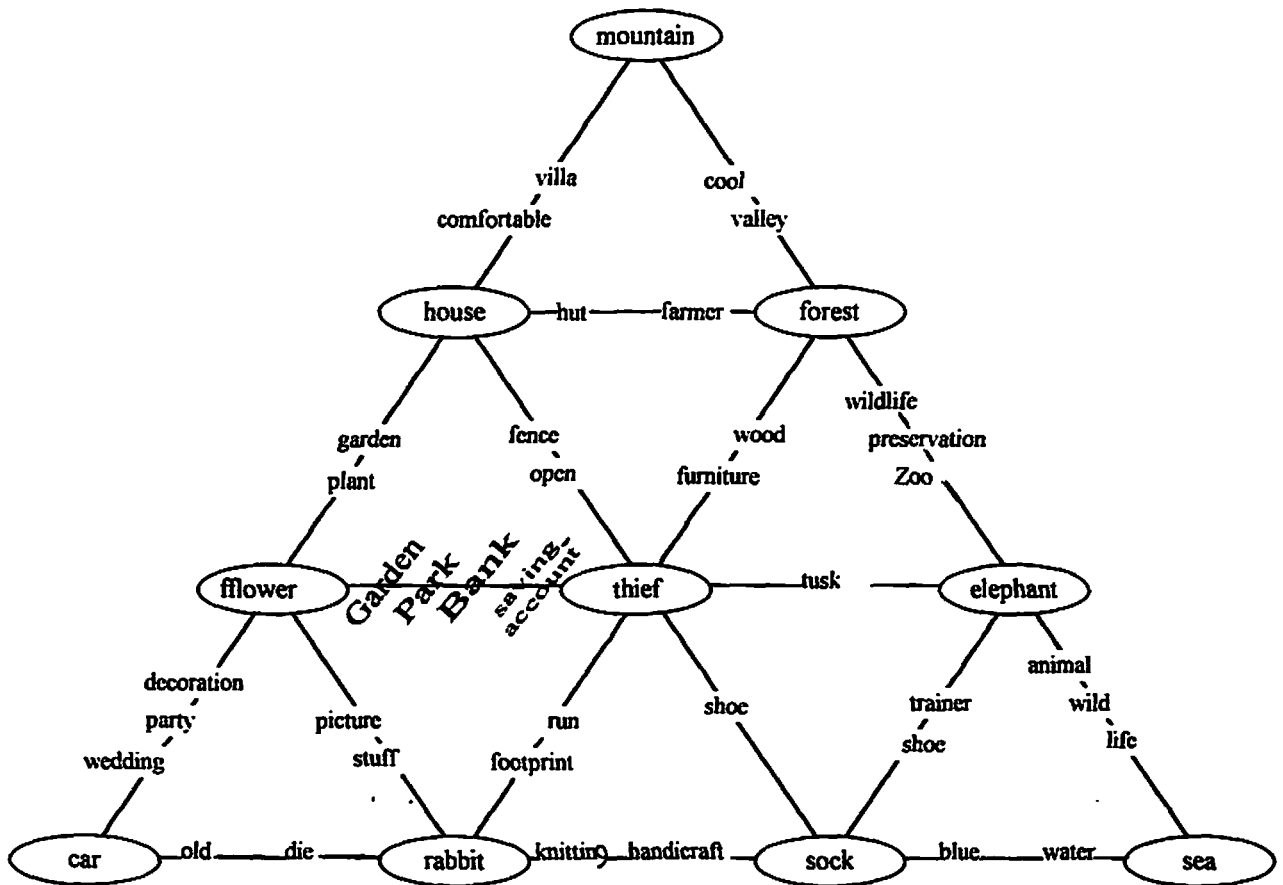

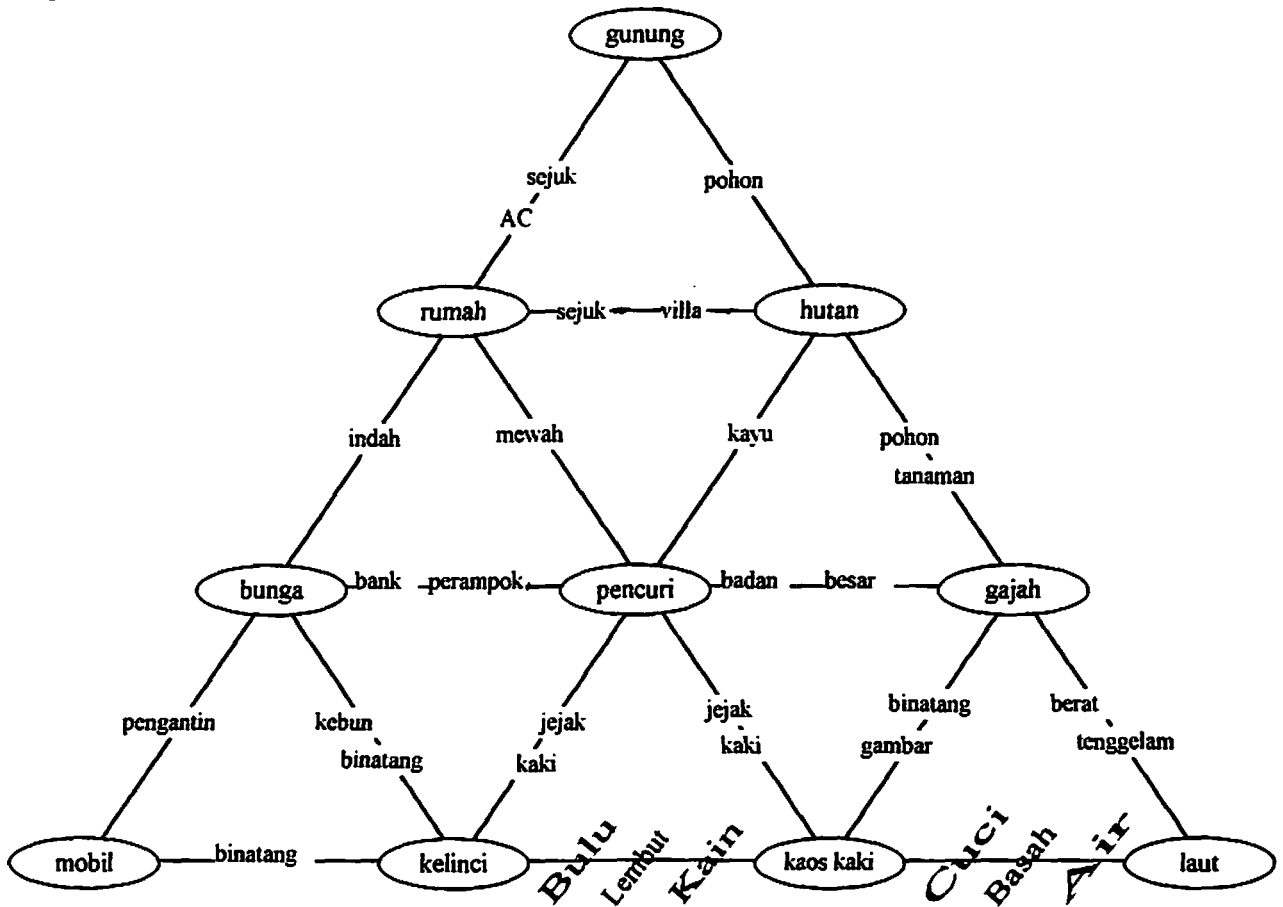

There are 30 respondents in this study and each respondent contributes two versions of semantic network structures. Thus, there are 60 semantic network structures presented in this chapter. They are arranged according to the respondents' numbers, who produced them; they are respondent number 1 to respondent number 30. Each page presents two different versions of semantic network structures. The Indonesian version appears first while the English version comes after it.
