A. Tatacara pemeriksaan aglutinasi, biokimiawi dan motilitas *Escherichia coli* (Baron at al., 1994; Munro, 1992).

1. Uji TSI (*Triple Sugar Iron*)

Uji ini bertujuan menentukan apakah bakteri (*Enterobacteriaceae*) mampu meragi laktosa, sukrosa dan dekstrosa, dean atau tanpa menghasilkan gas dan menghasilkan hidrogensulfida (H2S). Media adalah agar miring (isi media: 0,1% glukosa, 1% laktosa, 1% sukrosa dan sodium tiosulfat). Bakteri ditanam dengan menggunakan sengkelit, diusapkan pada permukaan *Slant* (bagian miring) dan dilanjutkan dengan menusukkan ke dalam *Butt* (bagian dasar). Pengeraman dilakukan suhu 37 °C semalam.

Hasilnya diiihat adanya reaksi berikut ini:

Bagian *Slant*	apakah ada perubahan warna menjadi kuning (=asam) atau tetap merah
Bagian *Butt*	a. apakah ada perubahan warna menjadi kuning (=asam) atau tetap merah (=alkali) b. apakah ada produksi gas yang ditandai munculnya bulatan ruang kosong berisi gas (Gas positif atau negatif) c. apakah ada produksi H2S yang ditandai munculnya warna hitam (H2S positif atau negatif).

2. Uji Indol

Uji ini bertujuan untuk menentukan apakah bakteri tersebut bisa manghasilkan indol. Uji dilakukan dengan membiakkan bakteri pada media cair triptofan suhu 37 °C selama 24 jam. Kemudian ditambahkan reagen Kovacs 0,5 ml (Reagen Kovac berisi: Iso amil alkohol 150 ml; Para dimetil amino benzaldehid 10 g; asam HCl murni 50 ml). Uji yang positif ditandai terbentuknya cincin warna merah di permukaan media cair.

3. Uji Merah Metil

Bertujuan menentukan apakah bakteri bisa menghasilkan keasaman yang tinggi pada media yang dipakai.

Bakteri dibiakkan pada media MR-VP (media Metil Red-Voges Proskauer = media glukose pepton fosfat yang berisi: pepton 5 g, K2HPO4 5 g, glukose 5 g, larutkan dengan akuadest sampai volume 1 liter), suhu 37 °C selama 2-4 hari. Tambahkan 5 tetes larutan Merah metil. Hasil uji positif ditandai munculnya warna merah pada media. (Reagen Merah metil: 0,1 g Merah metil; 300 ml 95% alkohol dan air sulinng 500 ml).

4. Uji Voges-Proskauer

Merupakan uji secara tidak langsung terhadap produksi 'Asetil Metil Karbinol'. Bila pada larutan biakan ada asetil metil karbinol, dan ditambah bahan alkali, maka akan terjadi asetil, dimana bahan ini akan bergabung dengan bahan dari pepton dan membentuk warna merah. Bakteri dibiakkan pada 5 ml media MR-VP, dieramkan 37 °C selama 48 jam. Pada 1 ml biakan tambahkan 5 tetes larutan KOH 40%, kemudian tambahkan 15

tetes reagen VP (5% alfa Naftol dalam etil alkohol). Kocok keras dan biarkan selama kira-kira 15 menit. Uji yang positif ditandai terjadinya warna pink.

5. Uji Pemakaian Sitrat

Untuk mengetahui apakah bakteri bisa memakai sitrat sebagai sumber karbon.

Bakteri dibiakkan pada media Simmons Sitrat Simmon (sebagai sumber karbon hanya dipergunakan sitrat), dieramkan suhu 37 °C selama 2-5 hari. Uji yang positif ditandai adanya pertumbuhan bakteri dan merubah indikator(Bromtimol biru) dari hijau menjadi biru gelap.

6. Uji Urease

Untuk mengetahui apakah bakteri mengahsilkan enzim Urease yang bisa memecah urea menjadi dua molekul amonia.

Bakteri dibiakkan dalam media cair urea (berisi: Urea 0,1%, KH2PO4 0,2%, NaCl 0,5%, dan ditambah merah fenol 0,5% sebanyak 0,24 ml setiap 100 ml media) dan dieramkan suhu 37 °C semalam. Hasil positif ditandai berubahnya warna media menjadi merah.

7. Uji motilitas

Disediakan 3-4 mililiter media semisolid dalam tabung reaksi. Dengan inokulum menggunakan sengkelit lancip, setelah dicelupkan dalam suspensi bakteri, sengkelit ditusukkan di bagian tengah ke dalam media semisolid. Dieramkan suhu 37 °C semalam. Hasil positif ditandai dengan adanya penyebaran pertumbuhan ke sekitar daerah tusukan

sebagai tanda adanya pertumbuhan dan pergerakan *Escherichia coli* ke sekitar akibat pergerakannya.

8. Uji aglutinasi (dipergunakan cara aglutinasi slide)

Pada permukaan gelas obyek yang bersih, taruh masing-masing satu tetes garam faali, satu untuk test satu untuk kontrol. Pada kedua tetes tersebut, suspensikan satu sengkelit biakan bakteri yang dicurigai. Selanjutnya pada bagian uji ditambahkan satu tetes antisera polivalen terhadap *Escherichia coli* dan pada bagian kontrol ditambahkan satu tetes garam faali. Gelas obyek digoyang antara 0,5 sampai 2 menit sambil dilihat adanya aglutinasi. Hasil positif ditandai terdapatnya gumpalan-gumpalan pada bagian uji dan tidak ada di bagian kontrol. Pengamatan hasil bisa dilakukan dengan mata telanjang atau menggunakan lensa pembesar. Dipergunakan antisera buatan Biofarma Bandung.

Spesies *Escherichia coli* ditegakkan berdasar hasil berikut ini:TSI (*Slant*: Asam; *Butt*: asam, ada gas, tidak ada H2S); Indol (positif); MR (positif); VP (negatif); Pemakaian sitrat (negatif); motilitas (positif); produksi urease (negatif) dan aglutinasi (positif). Lihat tabel berikut ini.
