SCOPE

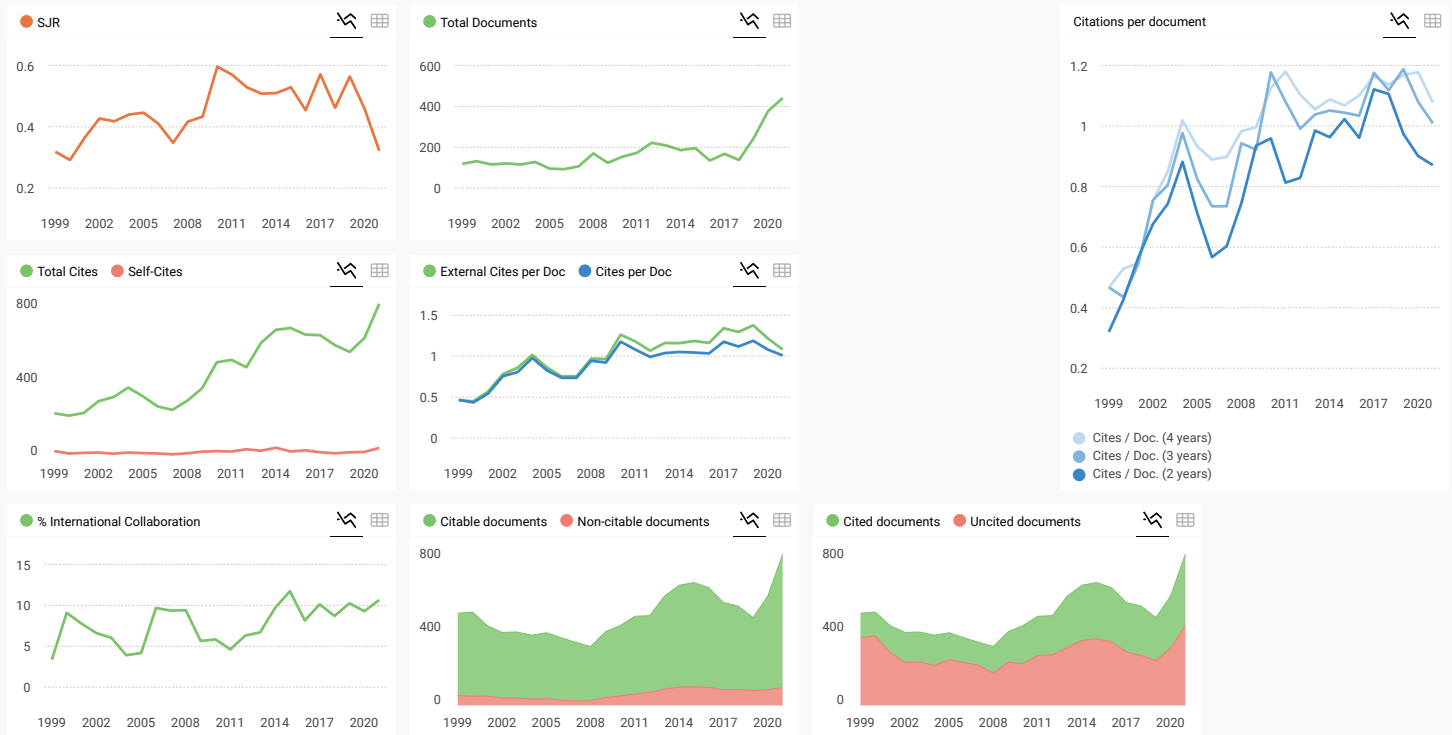

The British Journal of Neurosurgery is a leading international forum for debate in the field of neurosurgery, publishing original peer-reviewed articles of the highest quality, along with comment and correspondence on all topics of current interest to neurosurgeons worldwide. Coverage includes all aspects of case assessment and surgical practice, as well as wide-ranging research, with an emphasis on clinical rather than experimental material. Special emphasis is placed on postgraduate education with review articles on basic neurosciences and on the theory behind advances in techniques, investigation and clinical management. All papers are submitted to rigorous and independent peer-review, ensuring the journal's wide citation and its appearance in the major abstracting and indexing services.

The users of Scimago Journal & Country Rank have the possibility to dialogue through comments linked to a specific journal. The purpose is to have a forum in which general doubts about the processes of publication in the journal, experiences and other issues derived from the publication of papers are resolved. For topics on particular articles, maintain the dialogue through the usual channels with your editor.

ORIGINAL ARTICLE

Paralytic ileus in the patient with tuberculosis of spine

Viskasari P. Kalanjati* , Rury T. Oktariza*, Yahya Yahya and Abdulloh Machin

Faculty of Medicine, Universitas Airlangga—Dr. Soetomo General Hospital, Surabaya, Indonesia

ABSTRACT

Background: We reported a patient with spinal tuberculosis and paralytic ileus. A 56-year-old Javanese male presented with lower limb paralysis and bowel obstruction 2 weeks prior to admission. He was found to have hypoalbuminemia and hypesthesia from the T7/T9 levels and below. Other than increased alanine aminotransferase, hematology and blood chemical tests were normal. MRI and plain abdominal radiographs confirmed the diagnosis of spinal tuberculosis at the T5/6 level and paralytic ileus. Tubercles in the lymphoid tissue of the intestinal submucosa were not seen.

Conclusion: Paralytic ileus may occur in spinal TB.

ARTICLE HISTORY

Received 15 February 2019

Revised 10 June 2019

Accepted 1 July 2019

KEYWORDS

Pott's disease; paraplegia; intestinal obstruction; inflammation

Introduction

Dorsal spinal TB is typically associated with neurological complications due to the narrow canal and thoracic kyphosis.^{1,2} Destruction of the intervertebral disk space and vertebral bodies often leads to anterior wedging, kyphosis and gibbus formation.^{3,4} Paraplegia and autonomic nervous system impairment may occur.^{5,6} Here we report a case of spinal tuberculosis accompanied by paralytic ileus and hypoalbuminemia, which were improved gradually after initial treatment.

Case report

A 56-year-old Javanese male was admitted complaining of weakness of both legs for 2 weeks. He complained of fatigue decreased sensitivity from approximately below the rib cage. He had difficulties with micturition and defecation and mild dull abdominal pain for 9 days. He denied any fever or chronic cough history and was previously well. There were no affected family or neighbours. Vital signs were normal. The abdomen was distended and tympanic. His body mass index was 24.2. Neurological examination revealed paraplegia and hypesthesia from the T7/T9 levels and below. Reflexes were within normal limits.

Hematological and blood chemical examinations other than high ALT and low albumin levels, were within normal limits (ALT 131 U/L, albumin 2.88 g/dL). A paralytic ileus appearance was seen on abdominal x-rays (Figure 1). A Chest x-ray was clear. Spinal MRI showed destructions of the right T5 and both T6 pedicles. There was a paravertebral abscess at T5/6 compressing the spinal cord and forming a *curtain sign* appearance causing edema at these levels. Abdominal MRI did not show evidence of TB of the gastrointestinal tract or lymphadenopathy (Figure 2).

An NG tube was inserted. The patient was treated for hypoalbuminemia and ileus with intravenous aminofusid and 5% dextrose in water solutions, ranitidine and vitamins B1, B6 and B12. Anti TB chemotherapy was commenced 500 mg of isoniazid,

Figure 1. A plain abdominal x-ray of the patient showed coiled spring and bowel dilatation mixed with prominent fecal material with distribution until pelvic cavity.

450 mg of rifampicin, 1000 mg of ethambutol, 1500 mg pyrazinamide daily. Within 9 days, abdominal fullness improved and general condition improved. Further treatment and investigation were halted due to the patient's wishes.
