Comparison of the effects of synthesis methods of B, N, S, and P-doped carbon dots with high photoluminescence properties on HeLa tumor cells†

 Aswandi Wibrianto,^a Siti Q. Khairunisa,^b Satya C. W. Sakti,^{ac} Yatim L. Ni'mah,^d Bambang Purwanto^e and Mochamad Z. Fahmi^{id*ac}

Although heteroatom doping is widely used to promote the optical properties of carbon dots for biological applications, the synthesis process still has problems such as multi-step process, complicating the setting of instrument along with uncontrolled products. In the present study, some elements such as boron, nitrogen, sulfur, and phosphor were intentionally doped into citric acid-based carbon dots by furnace- and microwave-assisted direct and simple carbonization processes. The process produced nanoparticles with an average diameter of 5–9 nm with heteroatoms (B, N, S, and P) placed on the core and surface of carbon dots. Among the doped carbon dots prepared, boron-doped carbon dots obtained by the microwave-assisted (B-CDs2) process showed the highest photoluminescence intensity with a quantum yield (QY) of about 32.96%. All obtained carbon dots exhibit good stability (at pH 6–12 and high ionic strength concentrations up to 0.5 M), whereas cytotoxicity analysis showed that all doped carbon dots are low-toxic with an average cell viability percentage above 80% up to 500 $\mu\text{g mL}^{-1}$. It can be observed from the CLSM image of all doped carbon dots that the doping process not only increases the QY percentage, but also might accelerate the HeLa uptake on it and produce strong carbon dot emission at the cytoplasm of the cell. Thus, the proposed synthesis process is promising for high-potency bioimaging of HeLa cancer cells.

Introduction

Carbon-based nanomaterials have been widely used owing to their non-toxic attribute accompanied by the nanotechnology development on early cancer detection. Carbon dots (CDs) as a group of carbon nanomaterials have attracted much attention in the past few years due to their molecular size and

weight,¹ resistance to photobleaching and photodegradation,² excellent stability, high biocompatibility, and excellent low cytotoxicity compared to quantum dots and polymer dots.³ CDs can be synthesized from both synthetic and natural materials, such as citric acid, ascorbic acid, amino acids, glucose, and glycerol at high temperatures,⁴ *via* two common approaches, namely, the top-down method and the bottom-up method.⁵ The top-down method generally gives products with high yields but has many disadvantages including the complicating instrument, high cost, and uncontrollable morphology and size distribution of product yields.^{6,7} These limitations guide researchers to use the bottom-up method that was more promising with regard to size and shape.⁸ The bottom-up method consists of pyrolysis-based, template, chemical oxidation, thermal oxidation, reverse micelle and ultrasonic methods.⁶ One group of pyrolytic method, the carbonization based process through hydrothermal, microwave and ultrasonic methods has been mostly used. Although these methods yielded well-identified CDs, they still have disadvantages related to the complexity design, high cost and low luminescence intensity.^{9,10} Therefore, simple and low-cost strategies for overcoming these limitations need to be developed to intensify the optical properties of CDs.

Furthermore, to enhance the fluorescence intensity of CDs, several efforts were made, one of them being the surface modification involving heteroatom doping. Doping is suitable to increase the quantum yield (QY) in CDs, as it can form n-type (extra electron) and p-type (extra-hole) carriers, even simultaneously, so that the electronic structure of CDs can be changed.¹ Several elements such as boron,^{11,12} nitrogen,¹³ sulphur,¹⁴ and phosphorus were proposed as doping agents on CDs.¹⁵ Nitrogen- and sulphur-doped CDs were applied for the detection of Fe³⁺ ions and bioimaging.¹⁴ N-doped CDs (N-CDs) produce good visuals as excellent drug loading and delivery systems compared to the effects of cancer therapy such as chemotherapy.⁴ Boron, nitrogen, and sulphur doped into quantum dots (BNSQDs) produce a specific site in bioimaging cancer cells in the liver (HEPG2).¹⁶ Boron-doped carbon dots (B-CDs) can improve the nonlinear optical properties compared to carbon dots.¹⁷ Sulphur-doped carbon dots (S-CDs) are highly negatively charged particles because they contain sulphur and oxygen. This enables S-CDs to easily bind to the DNA-PEI complex. Therefore, S-CDs can be applied as bioimaging agents.¹⁸ Although there are many reports focusing on the nitrogen, boron, sulphur, and phosphorus doping effects on CDs, the integrative evaluation and direct comparison studies of the effect of these elements on CDs applied as cancer staining agents are still limited. It will be a crucial aspect regarding the advantages promised by CDs.

Principally, the pyrolytic process accentuates carbonization that is first accompanied with dehydration of the CD source and prevents massive attraction of oxygen. This has made the pyrolytic method need a special set up as shown in hydrothermal, ultrasonic and microwave-assisted method. However, the way of minimizing the complicating design and simplifying the reaction step will be interesting to be discussed. In our previous work, we promoted the preparation of CDs *via* direct pyrolysis of the carbon source from both organic and commercial materials, which proved the effectiveness of the process and the excellent applicability of CDs.^{19–21} Motivated to prepare attractive doped CDs, in the present study, we report a strategy to simplify the synthesis of CDs with direct carbonization of citric acid and the doping source simultaneously. Commercial chemicals such as boric acid, nitric acid, sulphuric acid, and phosphoric acid were used as boron, nitrogen, sulphur and phosphorus sources, respectively. For improved results, we used the carbonization process of CDs by giving furnace- and microwave-assisted treatments. Furthermore, the best doped CDs, based on their synthesis process, are applied as staining agents of HeLa cancer cells. This study utilized several characterization techniques including UV-Vis spectrophotometry, photoluminescence (PL), Fourier transform infra-red (FTIR) spectroscopy, X-ray diffraction (XRD), and atomic spectrum force microscopy (AFM). *In vitro* investigation to prove the cytotoxicity of CDs and its capability on HeLa markers was conducted by a CCK-8 assay along with confocal laser scanning microscopy (CLSM), indicating the potential use of CDs as HeLa staining agents.

Experimental

Materials

Citric acid (CA, 99.5%), boric acid (H₃BO₃), nitric acid (HNO₃, 65%), sulphuric acid (H₂SO₄, 95–97%), phosphoric acid (H₃PO₄, 85%), dimethyl sulfoxide (DMSO, 99.7%) and sodium hydroxide (NaOH) were purchased from Sigma-Aldrich (Germany). Ethanol (C₂H₅OH, 94–96%) was purchased from J. T. Baker (Malaysia). Hydrogen chloride (HCl, 37%) was purchased from Merck (Germany). Cell Counting Kit-8 (CCK-8), a cytotoxicity kit, was purchased from MedChemExpress (USA). All chemicals were used directly without further purification.

Synthesis of doping carbon dots by furnace- and microwave-assisted methods

The doped CDs were fabricated by following the latest work with some modifications.^{15,22,23} The bare CDs as well as boron-, nitrogen-, sulphur- and phosphorus-doped CDs were prepared by combining citric acid (88.9 mg) with boric acid, nitric acid, sulphuric acid and phosphoric acid following the composition given in Table 1, respectively. For the furnace-assisted method, each mixture was calcined at 300 °C for 2 h in an isolated reactor. For the microwave-assisted method, the mixtures (following on Table 1) were placed into a microwave reaction system with 600 watt power and high temperature for 2 hours. For all samples, after the samples were naturally cooled down to room temperature, the dark brown CDs were obtained as a stacked precipitate on the bottom of the reactor. To prepare its colloidal solution, the doped CDs with adjusted concentration were first prepared by dissolving in a NaOH solution (0.1 M), and the pH was set at a neutral value. The solution was then further dialyzed on the membrane with a molecular weight cut off (MWCO) of 1 kDa to specify the CD size distribution and exclude the by-product.

Viability cell assessment

The cytotoxicity test of doped CDs was performed in HeLa cancer cells by a cell counting kit-8 (CCK-8) assay (MedChemExpress, New Jersey, USA). HeLa cell lines were first cultured at a density of 2.5 × 10⁴ cells per well in a 96-well plate containing Dulbecco's modified Eagle's medium (DMEM) and

incubated for 24 h. Then, phosphate-buffered saline (PBS) was added to wash the cells. The cells were further incubated in 100 μL of DMEM with different concentrations of doped CDs (10 μL) for different durations. Once the adjusted time was reached, the reaction was continued by adding 1 mL of CCK-8 reagent (500 mg mL^{-1}) followed by incubation for 4 h. The absorbance of formazan on each plate correlated with the living cell was analyzed using a microplate reader at 450 nm. The cytotoxicity effects of doped carbon dots were assessed at half the cytotoxic concentration (CC_{50}) and fixed using the Origin software.

CLSM imaging assessment

For preparation, HeLa cells were cultured in a 6-well plate containing 2 mL Dulbecco's modified Eagle's medium (DMEM) and incubated for 24 hours. Each doped CD (400 μL) was further added and incubated for 1 h. The cells were then washed three times with PBS and fixed with 70% alcohol for about 10 min. Fluorescence images of doped carbon dots in HeLa cells were captured for immersion of 63×1.32 NA oil using confocal TCS SP2 (Leica Microsystems, USA) equipped with an inverted microscope and inline Ar (488 nm) and He-Ne (503–680 nm and 588 nm) laser.

Other characterizations

The synthesized products were characterized by several techniques. Fourier transform infra-red (FTIR) spectra were recorded using Infrared (IR) Tracer-100 (Shimadzu, Japan). Ultraviolet-visible (UV-Vis) spectra were recorded using a UV-Vis Shimadzu 1800 spectrophotometer (Shimadzu, Japan). The photoluminescence of doping carbon dots was collected using a LS 55 fluorescence spectrometer (Shimadzu, Japan). The PL of the doped CDs was determined comparatively by referring rhodamine 6G (R6G, QY (95%)); the % QY of doped CDs was calculated using the following equation:

$$\text{QY} = \text{QY}_{\text{R6G}}(I_{\text{CDs}}/I_{\text{R6G}})(A_{\text{CDs}}/A_{\text{R6G}})(\eta_{\text{water}}/\eta_{\text{ethanol}})^2$$

where I , A , and η are the integral PL intensity, UV absorbance and the optical density and reflective index of the solvent, respectively. Atomic force microscopic (AFM) images were acquired using a Nanoscan type AFM (Bruker, Germany).

In silico assessment

To represent all doped CDs with sp^2 and sp^3 features, we adopted pyrene-based systems with the doped elements and hydroxyl groups.^{24,25} The band gap was determined from the vertical electronic transition state data from each doped pyrene model that fully optimized using the density functional method with B3LYP²⁶ and orbital basis set at 6-31G + (d,p). The B3LYP/6-31G + (d,p) was chosen due to its proven capacity to generate the precise recurrence predictions.²⁷ The Hyper Chem 8.0 software program was used throughout this work.

Statistical analysis

The 50% cytotoxic concentration on cell viability (CC_{50}), was determined using the dose-response mode (nonlinear fitting) of the Origin software (version 8.0724, OriginLab Inc., Northampton, MA). All data were obtained in triplicate, with the sample t -test on some data.

Results and discussion

The CDs were synthesized by simply treating citric acid with doping sources by a furnace and microwave-assisted method (Schemes 1 and 2). Basically, both methods were carried out over thermal treatment that allows dehydration and carbonization at low and high temperatures, respectively, which allows the rearrangement of the structure as well as its integration to form a graphene-like structure. However, this restructuring process is initiated by hydrogen bonds formed by doping with citric acid and between citric acids itself (as shown in Scheme 1).²⁸ Further carbonization will be performed for CDs with graphene oxide (GO) structures on some parts. The formation of CDs was proven by luminescence of those CDs under UV light

Scheme 1 Schematic on the mechanism of doped carbon dots (B-CDs).

Scheme 2 Schematic of the synthesis reaction of each doped carbon dot.

(Fig. S1, ESI[†]). This phenomenon came surely from electron's movement on the orbital state of CDs. However, the detailed mechanism of this fluorescence emission is still a subject of debate.

Besides size confinement and solvent effects, the emission of CDs mainly resulted from the synergic effects of confined sp^2 conjugation on the core of CDs and functional groups attributed on the surface of CDs.^{29,30} Thus, addition of different elements composing CDs will be an interesting aspect to be explored, also relating its consequence on the resulting band gap and adsorption-emission mechanism as well. To resolve these questions, we first investigated the absorption spectra of doped CDs (Fig. 1). By utilizing the furnace-assisted method, the maximum absorbance of bare CDs (CDs1) was founded at 226 nm with a shoulder peak at 289 nm. B-CDs1, N-CDs1, S-CDs1 and P-CDs1 have maximum absorbance at 228, 222, 224, and 222 nm, and the second absorption as shoulder peaks at 288, 288, 281, and 288 nm, respectively. Furthermore, the microwave-assisted method resulted in CDs2 with maximum absorbance at 229 nm wavelength with a shoulder peak at 322 nm (Fig. 1b) and doped B-CDs2, N-CDs2, S-CDs2 and P-CDs2 with maximum absorbance and shoulder peaks, respectively at 229 and 322 nm; 223 and 322 nm; 227 and 326 nm; 233 and 323 nm; 223 and 326 nm. From these data, the absorption band at wavelengths less than 300 nm indicates the $\pi-\pi^*$ transition of the conjugated C=C bond associated with a carbon core (carbogenic core). The absorption band at wavelengths over 300 nm signified the existence of $n-\pi^*$ transitions from C=O bonds or other groups such as NH_2 .³¹ Although maximum absorption and its shoulder peak are quite similar in each method, the adsorption peaks are relatively different in both furnace- and microwave-assisted methods. These bring a tendency that the furnace-assisted method will yield a particular structure of doped CDs that is different from that yielded by the microwave-assisted method. To prove this, we further use

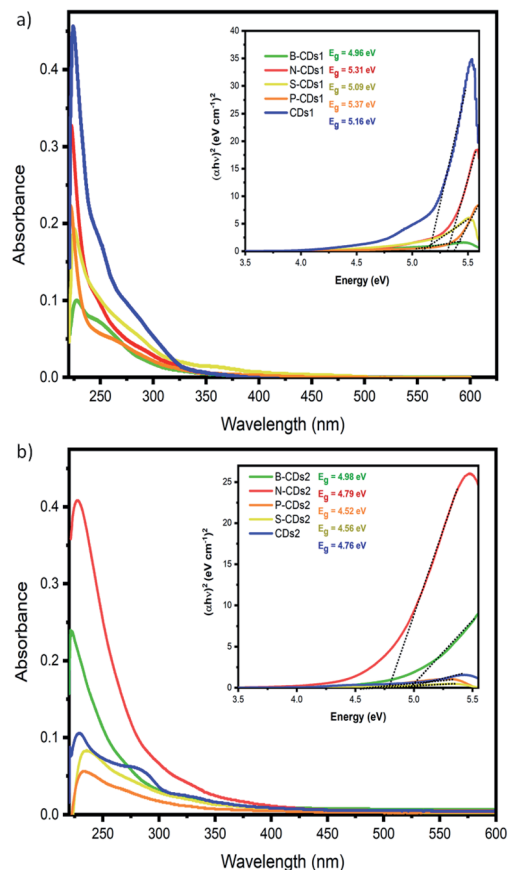

Fig. 1 UV-Vis spectra of doped carbon dots by (a) pyrolysis and (b) microwave-assisted methods. Inset: Tauc plot of each doped CD with its band gap measured.

the Tauc plot from the UV-Vis spectra data and find that the band gap values are varied (from 4.52 to 5.37 eV) depending on the doping and the method used (inset in Fig. 1). The sequence of the band gap in the furnace method is B-CDs1 < S-CDs1 < CDs1 < N-CDs1 < P-CDs1, while that in the microwave method is P-CDs2 < S-CDs2 < CDs2 < N-CDs2 < B-CDs2. These band gap differences are probably due to the complicating aspect to control the precise and homogenic structure of the proposed CDs. However, to get explanation for these phenomena, we further analogize proposed CDs with functionalized pyrene (Fig. S2, ESI[†]) and perform molecular modelling on pyrene to track the band gap that resulted with and without doping CDs (Fig. 2). The pyrene-based system was used for CD modelling based on the previous study. This computational modelling shows that the band gap energy of bare CDs and doped CDs follow a pattern in the microwave-assisted method, whereas B-CDs show the highest band gap compared with undoped CDs. These data indicated that the thermal induction from the microwave instrument can set carbonization, in which the position of doped atoms precisely matches with the proposed structure. In principle, microwave allows effective and fast heating of material *via* direct energy transfer and minimizes the dissipation of over-energy causing massive destruction that is common in the conventional heating process.³² Moreover, the

Fig. 2 Occupied (blue) and unoccupied (green) molecular orbitals of pyrene and doped pyrene as analogue structures of CDs and doped CDs, respectively. Energy level gap between HOMO and LUMO are described as double-line arrows with its energy values.

mechanism of heat transfer by the microwave treatment is considered by Joule heating from the conductive region of the π -system, which is the main part or any graphene-like structure including CDs; thus, this energy can accelerate and support effective carbonization to form CDs.³³ Furthermore, higher and lower band gaps on doped CDs are perhaps caused by doping type of proposed elements. Unlike boron, nitrogen, and phosphorus that mostly pretend as n-type, sulphur acts as a p-type upon CDs and other graphene-like structures, which is supposed to constrict the original band gap of CDs.^{34–36} Continuing on the optical properties investigation of doped CDs, we further evaluate the photoluminescence (PL) spectra of doped CDs1 (Fig. 3a–f) and doped CDs2 (Fig. 4a–f). With $\lambda_{\text{ex}} = 360$ nm, the emission fluorescence of all samples occurred at around 410–445 nm, which indicates strong blue fluorescence emission in aqueous solutions.³ The PL spectra also exhibit two overlapping peaks attributed to the π - π^* transition of C–C on the sp^2 domain of CDs (high electron transition) and the n - π^* transition as edge band transition of surface or doped groups (low electron transition). For most of the obtained CDs, the wavelength of emission (λ_{em}) shifted to a higher wavelength following the wavelength of excitation (λ_{ex}) exposure with a lower emission intensity. This excitation-dependent emission phenomenon commonly occurs in CDs by creating a new orbital trap known as the defect state due to the oxygenated group on CDs.^{37,38} It was well reported that all the doping elements have the potency to drive red-shift emission on a higher excitation wavelength;^{39,40} however, on B-CDs2 and N-CDs2, the PL spectra perform excitation-independent emission by wavelength maximum consistent at 455 nm (for λ_{ex} 360–400, Fig. 4b) and at 467 nm (for λ_{ex} 380–420, Fig. 4c), respectively. Among other doped CDs, carbon dot doped with H_3BO_3 by the microwave-assisted method (B-CDs2) shows the highest fluorescence

intensity. This is also indicated by the quantum yield (QY) value, in which the B-CDs2 value reaches 32.96%. For the quantum yield (QY) calculation, rhodamine 6G (R6G) was used as the reference (QY = 95%).⁴¹ Separately, the QY values for CDs1, B-CDs1, N-CDs1, S-CDs1, and P-CDs1 were sequentially 31.30%, 31.92%, 31.44%, 31.30%, and 31.37%; while for CDs2, N-CDs2,

Fig. 4 PL spectra of (a) CDs2, (b) B-CDs2, (c) N-CDs2, (d) S-CDs2, and (e) P-CDs2 at varied λ_{ex} . (f) PL spectra of all CDs prepared by pyrolysis method at λ_{ex} 360 nm.

S-CDs2, and P-CDs2, the values were 31.17%, 32.49%, 32.59%, and 32.09%, respectively (Fig. 4). The QY data obtained for CDs are comparable with previous studies, which indicates good optical properties of CDs (Table S1, ESI[†]). Based on these data, it can be concluded that the application of a direct carbonization process through furnace and microwave treatment is favorable. Moreover, the addition of doping to CDs effectively enhances the emission intensity.⁴²

FTIR analysis was then carried out to confirm the functional groups produced on doped CDs (Fig. 5). All the prepared CDs have broad absorption peaks at 3638 to 3223 cm^{-1} , which are attributed to the stretching vibration of O–H and at 2959 cm^{-1} attributed to the stretching vibration of C–H of benzene.³⁸ Wavenumbers at 1738 to 1767 cm^{-1} verify the presence of a carbonyl group (C=O) of CA and the wavenumber at 1531 cm^{-1} from C=C groups of the benzene-like structure. Wavenumbers at 1207 to 1020 cm^{-1} confirm that there is a C–O group.³ The successful doping process into CDs was also revealed by CDs, where a stretching vibration at 1450 cm^{-1} indicates the presence of the B–O group,¹⁷ while C–N vibration give an FTIR signal at 1436 cm^{-1} .⁴³ The S=C vibration appears at 1075 cm^{-1} (ref. 44) and P–O–C vibration at 904 cm^{-1} .⁴⁵ All the above bands prove that the doping agents can be attached on CDs by both pyrolysis and the microwave-assisted synthesis process. Furthermore, a morphology study of CDs was performed by AFM demonstrating the distribution and particle

Fig. 5 IR data of doped carbon dots by (a) pyrolysis and (b) microwave-assisted methods, including CDs (blue line), B-CDs (Green line), N-CDs (red line), S-CDs (yellow line), and P-CDs (orange line). The particular purple-dot lines indicating B–O (i); C–N (ii); S=C (iii) and P–O–C (iv).

sizes of doped carbon dots (Fig. 6). Moreover, the 3D topography of each doped CD is shown in Fig. S3 (ESI[†]). From this figure, the pyrolysis treatments produce mostly small-sized CDs. For further improvement on AFM data, we use ImageJ software to adjust the size distribution of the obtained CDs, where B-CDs1, N-CDs1, S-CDs1, and P-CDs1 have the average diameter sizes of about 8.63, 7.47, 8.97, and 7.60 nm, respectively, and B-CDs2, N-CDs2, S-CDs2, and P-CDs2 have average diameter sizes around 9.35, 9.11, 8.06, and 5.04 nm, respectively. All of the doped carbon dots are classified as carbon dots owing to the diameter size below 10 nm with mostly spherical shape.^{5,46} The XRD analysis (Fig. S4a) (ESI[†]) showed broad (amorphous) peaks in the range of 2θ from 15° to 50°, which signified a carbon structure in the diffractogram of B-CDs2 samples. The amorphous peaks exhibited a graphitic crystal structure confirmed by JCPDS26-1076.¹² Sharp peaks at 27.77° indicated the presence of boron in the carbon dots, which was confirmed by JCPDS 06-0297.^{47–49}

Fig. 6 AFM 2D topography images of (a) B-CDs1, (b) N-CDs1, (c) S-CDs1, (d) P-CDs1, (e) B-CDs2, (f) N-CDs2, (g) S-CDs2, and (h) P-CDs2. Inset: histogram data of distribution sizes.

B-CDs2 carbon dots were investigated even further by X-ray photoelectron spectroscopy (XPS) in order to acquire the existences of atoms including boron (B 1s), carbon (C 1s), and oxygen (O 1s) (Fig. S4b†). Table S2† shows the relative amount of carbon, oxygen, and boron, which were calculated as 56.85%, 39.63%, and 3.52%, respectively. The XPS C 1s spectrum is shown in Fig. S4d† displaying the presence of carbon signals at 285.1 (i) and 286.4 eV (ii), which indicated the existence of benzene and methoxy groups (C–O).⁵⁰ Then, the carbon spectrum at 289.6 eV (iii) clarified the presence of C=O (ester) of boric acid (H_3BO_3) conjugated to carbon dots.¹² High-resolution XPS shows O 1s spectra (Fig. S4e†) with peaks at 531.1 (iv), 532.2 (v), and 533.3 eV (vi), which were assigned to the presence of H–O, C–O, and B–O groups in carbon dot B-CDs2. Further measurements on the B 1s spectrum (Fig. S4c†) at 193.0 eV (vii) showed the presence of B–O groups in the sample.¹⁷

Stability evaluation of the doped-carbon dots

Colloidal stability analysis of the doped CDs was improved against different pH and NaCl concentrations (Fig. 7). This analysis is considered as stability data are important aspects for using nanomaterials in clinical applications. We first set doped CDs with a pH value ranging from 3 to 12 and observe that no precipitation nor agglomeration appeared by all of the doped pH (Fig. S5, ESI†). The stipulation of the pH range used in this investigation is based on the consistency of the pH value at intracellular areas of cells at pH 4.5 and pH 8 in the pancreas;⁵⁰ a previous study also reported that the optimal pH in the intracellular environment is from pH 4.5 to pH 7.5.¹⁵ However, B-CDs2 shows instability with significant precipitation at pH 3–4 and slight precipitation at pH 5 after 24 h, and it also happens in N-CDs2 at pH 3. These stability data toward the varying pH indicate that all of the doped CDs can be safely transferred at pH 6–12 to a human body without any harmful degradation.

Further, stability analysis was focused on the endurance of the CDs at different salt concentrations (from 0.1 M to 0.5 M), covering the normal ionic strength concentration (from 0.015 M to 0.14 M).⁵¹ Similar to its stability over pH, Fig. S6 (ESI†) proves that the doped CDs are quite resistant in facing the ionic effect of NaCl, even at high concentrations and over 24 h. To improve visual observation data of this stability, we next inspect the turbid value of each solution (Fig. 7). These considered as the colloidal system was once destructed, a precipitate would be produced and it could be tracked by increasing the turbidity level. The turbidity data on Fig. 7a inform its consistency with visual observation data, where all doped CDs perform good stability ($\leq 4,88$ NTU) on facing varied pH except pH 3–5 that is mostly greater than 6 NTU. The increasing of turbidity value on low pH condition occurred on all of the doped CDs. As well predicted before, CDs acts with abundant functional groups such as hydroxyl and carbonyl groups disposing as electronegative sites, forming hydrogen bonds intensely in an acidic atmosphere. This bonding will attract other CDs leading to CD accumulation and resulting in precipitate formation. However, the general turbidity of CDs on average is 4 to 5 NTU. Moreover, at different NaCl concentrations (Fig. 7b), all of the doped CDs show no significantly different turbidity level compared with the control (zero NaCl concentration). These data indicate that the doped CDs show good stability performance. This finding is supported by previous studies where the carbon dot modified at MnFe_2O_4 was stable at a salt concentration of 0.5 M.⁵⁰ Hence, all doped CDs have potential to be used in biomedical applications.

In vitro assessments

The simple synthesis and doping method proposed in this study was further directed to biomedical application by observing its capability in staining HeLa cancer cells. Although

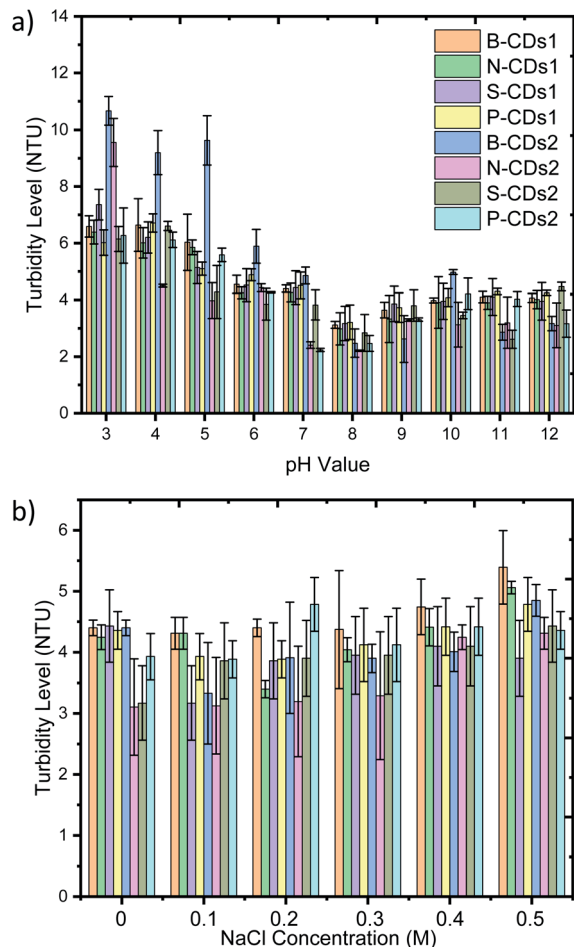

Fig. 7 Turbidity data of B-CDs1 (Orange); N-CDs1 (Bright Green); S-CDs1 (Purple); P-CDs1 (Yellow); B-CDs2 (Blue); N-CDs2 (Magenta); S-CDs1 (Green); P-CDs1 (Deep Sky Blue) at different (a) pH and (b) NaCl concentrations after 24 h. All data are expressed as mean \pm SD ($n = 3$).

boron doping on CDs was nominated as the best optical property (exhibit high % QY), the *in vitro* investigation on all of doped CDs are important to be revealed, due to comparable data. Cytotoxicity test by a CCK-8 assay was first carried out to discover the toxicity of the doped CDs. These methods use WST-8 or 2-(2-methoxy-4-nitrophenyl)-3-(4-nitrophenyl)-5-(2,4-disulfophenyl)-2H-tetrazolium monosodium salt, resulting in water-soluble formazan upon reduction process with mitochondrial dehydrogenases in living cells. Thus, the concentration of produced formazan is correlated with number of living cells. The CCK-8 results in Fig. 8 showed that the HeLa cell viability decreases with the increase in doped CD concentration after 24 h incubation. However, the viability was still greater than 80% on all doped CDs at 250 $\mu\text{g mL}^{-1}$, and it could first suggest the low-toxic property of doped CDs. Based on ISO 10993-5, the cell viability range of 120–80% indicates the low-toxic effects on cells.^{52,53} Improvements on these cytotoxicity data have been done by determining 50% cytotoxicity concentration (CC_{50}) of each doped CDs1 (Fig. 9) and CDs2 (Fig. S7, ESI⁺). The data shows that the CC_{50} of B-CDs1, N-CDs1, S-CDs1, P-CDs1, B-CDs2, N-CDs2, S-CDs2, and P-CDs2 are: 5289.15, 9217.56,

Fig. 9 Cell viability plot of HeLa cancer cells after 24 h incubation (a) B-CDs1, (b) N-CDs1, (c) S-CDs1, and (d) P-CDs1 by the microwave-assisted method. CC_{50} values were plotted on the red fitted curves that resulted from the dose response mode on the Origin software. All data are expressed as mean \pm SD with $n = 3$.

Fig. 10 Photograph CLSM images of HeLa cells after 1 h incubated without (control) and with the doped CDs by excitation at 488 nm. The scale bars represent 30 μm .

3725.18, 6710.52, 2444.72, 1945.04, 3218.58, and 40 318.13 $\mu\text{g mL}^{-1}$, respectively. The results, all over 1000 $\mu\text{g mL}^{-1}$, strongly indicated the low-toxic property on all doped CDs. The low-toxic statement in the present study can be recognized, while compared with other CDs reported from a previous study (Table S3, ESI[†]). Thus, all doped carbon dots are safe to be used in biological applications because these carbon dots have low toxicity in cells.

Further *in vitro* analysis was directed to discovering the capabilities of CDs as bioimaging agents using CLSM analysis. The CLSM results in Fig. 10 show that doped CDs can work well as HeLa markers compared with untreated cells (control). The figure also confirms that doped CDs can be effectively internalized to the cytoplasm of HeLa cells after 24 h incubation *via* the endocytosis process. To prove the entering mechanism, we captured the CLSM images of HeLa cells incubated with B-CDs1 for 10 min (Fig. S8, ESI[†]) that furnished low emission on the cell cytoplasm, whereas high emission on its membrane. These imply that the insertion of CDs occurred *via* the membrane-mediated endocytosis process. Although the cellular uptake of the doped CDs works through a passive targeting way (non-chemical interaction), the existence of boron elements allows the insertion of CDs *via* endocytosis mediated by sialic acid receptors overexpressing abundantly on the cell membrane of HeLa cells. Thus, it opens up the possibility of an active targeting process of CD cellular uptake, encouraging massive insertion as well as increased strong emission of the CDs in the cytoplasm of HeLa cells.⁵⁰ Moreover, it was previously reported that nitrogen, sulphur and phosphor elements assist in the cellular uptake due to the emerging additional attraction of these elements with the cellular membrane.^{54,55} The CLSM results proved the above statements supporting that the doping elements encourage CDs to perform strong emission feature. Moreover, this finding indicates the good potential of the doped CDs to be applied on cancer cell staining agents.

Conclusions

In summary, carbon dots can be synthesized from citric acid by doping boron, nitrogen, sulphur, and phosphor atoms by

a furnace- and microwave-assisted carbonization process. Several characterizations proved the successful doping of CDs, that is strengthened by *in silico* data. All doped CDs exhibited good colloidal stability, with the B-CDs2 compounds showing the highest optical property (QY value 32.96%), stable at pH 6–12 as well as ionic strength up to 0.5 M. The cytotoxicity assessment revealed that all the doped CDs are low-toxic with CC_{50} values on the upper grade comparing some previous study. The CLSM study showed the potential application of doped CDs as staining agents, and the doping elements on CDs facilitate the cellular uptake of CDs passing through the cellular membrane, thus performing significant CD emission in the cytoplasm.

Conflicts of interest

The authors declare no competing interest on present study.

Submit your article
(<https://mc.manuscriptcentral.com/rscadv>)

Supporting our community through Covid-19

We know that this is a very challenging time for everyone, for many different reasons. If any aspect of the publishing process is worrying you – for example you think you may struggle to meet a pre-determined deadline – please let us know, and we will work out an answer together.

Setting up remote access to RSC content

You can find details about how to access information remotely in this [step-by-step guide](/covid-19-response/publishing-remote-access/). The guide will also help if for any reason you have difficulty accessing the content you want.

RSC Advances publishes advances in chemistry, and in topics of interest to the chemistry community.

Thoughts from our Editor-in-chief

"Scientific publishing is entering an exciting period when high ethical standards, visibility and impact are all important to authors. I'm honoured to be chairing the board of *RSC Advances* which has already pioneered an open access publishing model for the benefit of authors and readers."

Russell J Cox, Editor-in-chief.

As the largest gold open access journal dedicated to the chemical sciences, we are here for everyone who wants to publish quality chemistry research and share it with the world.

We are here for everyone who needs access to work in every area of the chemical sciences and related disciplines.

And as part of the Royal Society of Chemistry, we are at the heart of open, international research dissemination for the chemistry community.

Great science matters. We make sure the world knows it.

Impact factor: 3.119*

Indexed in Scopus, Web of Science and DOAJ

Breadth

We publish work in all areas of chemistry and reach a global readership

Affordability

Low APCs, discounts and waivers make publishing open access achievable and sustainable

Quality

Research to advance the chemical sciences undergoes rigorous peer review for a trusted, society-run journal

Community

Led by active researchers, we publish quality work from scientists at every career stage, and from all countries

RSC Advances in numbers

An impact factor above **3**

Submissions from **100+** countries in 2020

An average of **30** days from submission to first decision

An average acceptance rate of **46%**

Associate editors in **25+** countries

20,000+ articles free to access and growing

RSC Advances: why publish with us?

Scope

RSC Advances papers should provide an insight that advances the chemistry field. Papers that contain little or no chemistry and are not considered to be of interest or relevance to the chemistry community are not within the scope of the journal.

The criteria for publication are that the work must be high quality, well conducted and advance the development of the field. Articles submitted to the journal are evaluated by our international team of associate editors and reviewers for the overall quality and accuracy of the science presented.

Download our [full list of subject categories](https://globalassets/05-journals-books-databases/our-journals/rsc-advances/full-list-of-subject-categories-for-rsc-advances.pdf) to see the range of topics we publish in *RSC Advances*.

Please ensure you have considered the following points before submitting your manuscript.

- Does the work present a significant advance over the existing literature? **Please supply a covering letter with your submission to demonstrate how the work is advancing the field over the existing literature.**
- Have you provided sufficient evidence/data to support your conclusions?
- Have you provided adequate characterisation data for your materials/compounds? (Please check the supporting information section to ensure that the necessary requirements have been met and copies of relevant spectra have been provided where necessary.)
- Are the results discussed in the context of the literature?
- Are the references relevant and do they appropriately reflect the existing literature?

Article processing charges and licensing

Following our peer review process, if the article is accepted, the article processing charges below will be applied to your article. There are no submission charges for *RSC Advances*.

	Article processing charge
Full price	£750 (+local taxes if applicable)*
Corresponding authors from India, Indonesia and Philippines	£500 (+local taxes if applicable)
Corresponding authors from Research4Life Group A & Group B	Full APC waiver

*15% RSC member and [R&P Institution](https://journals-books-databases/open-access/read-and-publish/community/) discount available.
Applicable to full price only.

Discounts and waivers are also available on an individual basis. Find out more about applying for a [waiver](https://journals-books-databases/open-access/gold-open-access/).

Corresponding authors who pay an APC and are not already members of the Royal Society of Chemistry are entitled to one year's Affiliate membership as part of their APC. Find out more about our [member benefits](https://membership-and-community/join/#benefits).

As part of the submission process, authors will be asked to agree to the *RSC Advances* open access terms & conditions.

We offer *RSC Advances* authors a choice of two Creative Commons licences, CC-BY or CC-BY-NC. Publication under these licenses means that authors retain copyright of their article, but allows users to read, download, copy, distribute, print, search, or link to the full texts of articles, or use them for any other lawful purpose, without asking prior permission from the publisher or the author. Read our [open access statement](https://journals-books-databases/open-access/open-access-info/#hide1) for further information.

All published articles are deposited with LOCKSS, CLOCKSS, Portico and the British Library for archiving.

Emerging Investigators series

We are delighted to announce the start of an Emerging Investigators series! This series will showcase some of the best research from scientists in the early stages of their independent careers. The series will be guest edited by Professor James Batteas (Texas A&M University), and articles in the series will be accepted and published throughout the year. In addition, an Editorial article featuring recent researchers in the issue will be published annually.

[Read more about this series](#) +

Outstanding Student Paper Awards

We are delighted to announce *RSC Advances* Outstanding Student Paper Awards in 2021. These awards recognise outstanding work published in the journal, for which a substantial component of the research was conducted by a student. Winning papers will be selected by the Editorial Board and Associate Editors in 2022. Winning students receive a framed certificate and will be invited by *RSC Advances* to give a virtual talk about their research to an international audience.

To: m.zakki.fahmi@fst.unair.ac.id, zakkifahmi@gmail.com

Fri, Dec 4, 2020 at 11:58 AM

04-Dec-2020

Dear Mr Fahmi:

Manuscript ID: RA-ART-11-2020-009403.R1

TITLE: Comparison method effect on synthesize B, N, S, and P-doped carbon dots with high photoluminescence property on HeLa tumor cells

Thank you for your submission to RSC Advances, published by the Royal Society of Chemistry. I sent your revised manuscript to one of the original reviewers and I have now received their report which is copied below.

After careful evaluation of your manuscript and the reviewer's report, I will be pleased to accept your manuscript for publication after revisions.

Please revise your manuscript to fully address the reviewer's comments. When you submit your revised manuscript please include a point by point response to the reviewer's comments and highlight the changes you have made. Full details of the files you need to submit are listed at the end of this email.

Please submit your revised manuscript as soon as possible using this link:

*** PLEASE NOTE: This is a two-step process. After clicking on the link, you will be directed to a webpage to confirm. ***

https://mc.manuscriptcentral.com/rscadv?URL_MASK=a30941b84e49494aba51dd29a8707357

(This link goes straight to your account, without the need to log in to the system. For your account security you should not share this link with others.)

Alternatively, you can log in to your account (<https://mc.manuscriptcentral.com/rscadv>) where you will need your case-sensitive user ID and password details.

You should submit your revised manuscript as soon as possible; please note you will receive a series of automatic reminders. If your revisions will take a significant length of time, please contact me. If I do not hear from you, I may withdraw your manuscript from consideration and you will have to resubmit. Any resubmission will receive a new submission date.

Supporting our community through Covid-19

While our publishing services are running as usual, we also know that this is a very challenging time for everyone, for many different reasons. If any aspect of the publishing process is worrying you – for example you think you may struggle to meet a pre-determined deadline – please let us know, and we will work out an answer together.

RSC Advances is a gold open access journal. If accepted, your manuscript will be published open access and the appropriate article processing charge (APC) will apply. Discounted APCs and full APC waivers for corresponding authors in certain countries are available. All authors are given the option to apply for a waiver after signing the open access licence - please see the following URL for more details: <https://www.rsc.org/journals-books-databases/about-journals/rsc-advances>

RSC Advances strongly encourages authors of research articles to include an 'Author contributions' section in their manuscript, for publication in the final article. This should appear immediately above the 'Conflict of interest' and 'Acknowledgement' sections. I strongly recommend you use CRediT (the Contributor Roles Taxonomy from CASRAI, <https://casrai.org/credit/>) for standardised contribution descriptions. All authors should have agreed to their individual contributions ahead of submission and these should accurately reflect contributions to the work. Please refer to our general author guidelines <http://www.rsc.org/journals-books-databases/journal-authors-reviewers/author-responsibilities/> for more information.

The Royal Society of Chemistry requires the submitting author to provide their ORCID iD when they submit a revised

manuscript. This is quick and easy to do as part of the revised manuscript submission process. We will publish this information with the article, and you may choose to have your ORCID record updated automatically with details of the publication.

Please also encourage your co-authors to sign up for their own ORCID account and associate it with their account on our manuscript submission system. Please note that we are unable to do this on behalf of your co-authors. For further information see: <https://www.rsc.org/journals-books-databases/journal-authors-reviewers/processes-policies/#attribution-id>.

I look forward to receiving your revised manuscript.

Yours sincerely,
Dr Alexey M Glushenkov
Associate Editor, RSC Advances

REVIEWER REPORT(S):
Referee: 2

Recommendation: Accept

Comments:

Regarding the molecular modeling, the references need to be cited in the main article. The specific details need to be provided in the Experimental part.

Additional Questions:

Does the work significantly advance the understanding or development in this field?: Yes

Is this work of relevance to the chemistry community?: Yes

Are the conclusions of the work convincing and sufficiently supported by experimental evidence?: Yes

Is the experimental section sufficiently detailed to allow others to reproduce the work?: Yes

Are the reported claims adequately discussed in the context of the literature?: Yes

Are the number of tables and figures in the manuscript appropriate and clear?: Yes

FILES TO PROVIDE WITH YOUR REVISED MANUSCRIPT:

IMPORTANT: Your original files are available to you when you upload your revised manuscript. Please delete any redundant files before completing the submission. Please carefully check the spelling and format of all author names, affiliations and funding information. If your paper is accepted for publication, it is important this information is accurate to ensure your article is correctly indexed, which may affect citations and future funding evaluation.

- A point-by-point response to the comments made by the reviewer(s)
- Your revised manuscript with any changes clearly marked (.doc(x) or .pdf file)
- Your revised manuscript as a .doc(x) file including figures, without highlighting, track changes, etc. (If providing in TeX format instead, please also provide a final PDF version including figures). Please note that we cannot proceed with publication using a .pdf file only.
- A table of contents entry: graphic maximum size 8 cm x 4 cm and 1-2 sentence(s) of text, with a maximum of 250 characters, highlighting the key findings of the work. See our Author Guidelines for more details:

<https://www.rsc.org/journals-books-databases/author-and-reviewer-hub/>

High quality figures

EITHER

embedded in a doc(x) file

OR

as numbered figures in separate files in .tif, or .eps format, with a resolution of 600 dpi or greater and structures preferably as ChemDraw files. Chemwindow files (.cwg/.cw2), ISIS/Draw exported in sketch format (.skc) and ChemSketch exported in ChemDraw format (.cdx) may also be supplied.

AND

- Your revised Electronic Supplementary Information (if any)
- Your revised CheckCIF reports (if any). Please ensure that any revised cif files have been deposited with the Cambridge Crystallographic Data Centre (CCDC) via <https://deposit.ccdc.cam.ac.uk/> before you submit your revised manuscript.

For Feature Articles/Review-type articles only:

- A photograph and biography of yourself and your co-authors. Separate photographs of each author may be supplied

or if you prefer, a group photograph, saved as a .tif, .pdf or .jpeg file. The resolution of the photographs should be 600 dpi or higher. The dimensions of the photograph in the printed journal will be 4 cm wide x 5 cm high (individual photograph) or 8.3 cm wide x 5 cm high (group photograph). Individual photographs should be accompanied by a maximum of 100 words; a group photograph by a maximum of 200 words. There can be a maximum of 6 individual biographies per article.

• Copies of permissions required from other publishers to reproduce figures. Please ensure that necessary permissions are acknowledged in the figure captions in accordance with the publishers' instruction. Information on how to obtain permissions and rights that we require are given on our website at

<https://www.rsc.org/journals-books-databases/journal-authors-reviewers/licences-copyright-permissions/>

If you need to contact the journal, please use the email address advances@rsc.org

06-Dec-2020

Dear Mr Fahmi:

Manuscript ID: RA-ART-11-2020-009403.R2

TITLE: Comparison method effect on synthesize B, N, S, and P-doped carbon dots with high photoluminescence property on HeLa tumor cells

Thank you for submitting your revised manuscript to RSC Advances. After considering the changes you have made, I am pleased to accept your manuscript for publication in its current form.

You will shortly receive a separate email from us requesting you to submit a licence to publish for your article, so that we can proceed with publication of your manuscript.

RSC Advances is a gold open access journal. Your manuscript will be published open access and the article will be subject to the appropriate article processing charge (APC). Discounted APCs and full APC waivers for corresponding authors in certain countries are available. All authors are given the option to apply for a waiver after signing the open access licence - please see the following URL for more details: <https://www.rsc.org/journals-books-databases/about-journals/rsc-advances>

We are offering all corresponding authors who are not already members of the Royal Society of Chemistry one year's Affiliate membership as part of their APC. If you would like to find out more please email membership@rsc.org, including the promo code OA100 in your message.

Learn all about our member benefits at <https://www.rsc.org/membership-and-community/join/#benefit>

We will email you information on how to access your RSC Advances article proofs shortly.

As an author you are entitled to a 25% discount on books published by the Royal Society of Chemistry. To receive this discount, enter the promotional code JLTH25 when purchasing from our online bookshop (pubs.rsc.org/bookshop). Please contact booksales@rsc.org if you have any problems.

Discover more Royal Society of Chemistry author services and benefits here:

<https://www.rsc.org/journals-books-databases/about-journals/benefits-of-publishing-with-us/>

Thank you for publishing with RSC Advances, a journal published by the Royal Society of Chemistry – connecting the world of science to advance chemical knowledge for a better future

With best wishes,

Dr Alexey M Glushenkov
Associate Editor, RSC Advances

If you need to contact the journal, please use the email address advances@rsc.org

Dear Mr Fahmi:

TITLE: Comparison method effect on synthesize B, N, S, and P-doped carbon dots as dual high photoluminescence and selective to HeLa tumor cells

Thank you for approving the transfer of your manuscript to RSC Advances, published by the Royal Society of Chemistry. The files are now in the Author Centre of the submitting author. Please check the submission details and upload any revised files to continue your transfer.

To do this, please log in to the RSC Advances Author Centre (<https://mc.manuscriptcentral.com/rscadv>) of the original submitting author, where you will find your manuscript listed under 'Transferred Unsubmitted Manuscripts'.

When you submit your transferred manuscript, please provide revised files if required, see the list at the end of this email for details.

RSC Advances is an international, gold open access journal publishing high-quality research from across the chemical sciences, including multidisciplinary and emerging areas. RSC Advances has a 2015 impact factor of 3.289 and publishes a single primary research article type (paper) as well as review articles. By publishing in RSC Advances, authors benefit from immediate page number assignment on publication and sophisticated topic modelling technology to ensure the visibility of their research.

RSC Advances is a gold open access journal. If accepted, your manuscript will be published open access and the article will be subject to the appropriate article processing charge (APC). Discounted APCs and full APC waivers for corresponding authors in certain countries are available. All authors are given the option to apply for a waiver after signing the open access licence - please see the following URL for more details: <https://www.rsc.org/journals-books-databases/about-journals/rsc-advances>

The Royal Society of Chemistry requires the submitting author to provide their ORCID iD when they submit a revised manuscript. This is quick and easy to do as part of the revised manuscript submission process. We will publish this information with the article, and you may choose to have your ORCID record updated automatically with details of the publication.

Please also encourage your co-authors to sign up for their own ORCID account and associate it with their account on our manuscript submission system. Please note that we are unable to do this on behalf of your co-authors. For further information see: <https://www.rsc.org/journals-books-databases/journal-authors-reviewers/processes-policies/#attribution-id>.

Please contact us if we can be of any assistance.

Yours sincerely,
RSC Advances Editorial Office

FILES TO PROVIDE WITH YOUR TRANSFERRED MANUSCRIPT:

IMPORTANT: Your original files are available to you when you upload your revised manuscript. Please delete any redundant files before completing the submission. Please carefully check the spelling and format of all author names, affiliations and funding information. If your paper is accepted for publication, it is important this information is accurate to ensure your article is correctly indexed, which may affect citations and future funding evaluation.

- A point-by-point response to the comments made by the reviewer(s)
- Your revised manuscript with any changes clearly marked (.doc(x) or.pdf file)
- Your revised manuscript as a .doc(x) file including figures, without highlighting, track changes, etc. (If providing in TeX format instead, please also provide a final PDF version including figures). Please note that we cannot proceed

with publication using a .pdf file only.

High quality figures

Dear Mr Fahmi:

Manuscript ID: RA-ART-11-2020-009403

TITLE: Comparison method effect on synthesize B, N, S, and P-doped carbon dots as dual high photoluminescence and selective to HeLa tumor cells

Thank you for your submission to RSC Advances, published by the Royal Society of Chemistry. I sent your manuscript to reviewers and I have now received their reports which are copied below.

I have carefully evaluated your manuscript and the reviewers' reports, and the reports indicate that major revisions are necessary. In particular, you can see that the referee suggest that the novelty of the work needs to be outlined and the results need to be discussed in the context of the field.

Please submit a revised manuscript which addresses all of the reviewers' comments. Further peer review of your revised manuscript may be needed. When you submit your revised manuscript please include a point by point response to the reviewers' comments and highlight the changes you have made. Full details of the files you need to submit are listed at the end of this email.

Please submit your revised manuscript as soon as possible using this link:

*** PLEASE NOTE: This is a two-step process. After clicking on the link, you will be directed to a webpage to confirm.

https://mc.manuscriptcentral.com/rscadv?URL_MASK=7133d37cdd6046c9bfa8398cdfcaf5a3

(This link goes straight to your account, without the need to log on to the system. For your account security you should not share this link with others.)

Alternatively, you can log in to your account (<https://mc.manuscriptcentral.com/rscadv>) where you will need your case-sensitive user ID and password details.

You should submit your revised manuscript as soon as possible; please note you will receive a series of automatic reminders. If your revisions will take a significant length of time, please contact me.

Supporting our community through Covid-19

While our publishing services are running as usual, we also know that this is a very challenging time for everyone, for many different reasons. If any aspect of the publishing process is worrying you – for example you think you may struggle to meet a pre-determined deadline – please let us know, and we will work out an answer together.

RSC Advances is a gold open access journal. If accepted, your manuscript will be published open access and the appropriate article processing charge (APC) will apply. I look forward to receiving your revised manuscript.

Yours sincerely,
Dr Alexey M Glushenkov
Associate Editor, RSC Advances

REVIEWER REPORT(S):

Referee: 1

Recommendation: Reject

Comments:

In this work by Wibrianto et al. the authors prepare several CDs with various dopants and compare their optical properties. They use boron doped CDs in deeper studies including aqueous stability measurements at different pH and ionic strengths and test these CDs with HeLa cells for viability and imaging capability. The authors' comparison of different dopants and methods is a good idea, but there is not much new information obtained. Additionally, the use of CDs with cells appears promising, but this is not a new phenomenon for CDs. Some comments to improve the manuscript are below:

1. The wording and grammar throughout the manuscript should be revised for clarity purposes. This revision should begin with the title as the use of the words "dual" and "selective" are not clear.
2. The caption for Scheme 1 refers to "internalization into HeLa cells", but this is not seen anywhere in the figure.
3. The abstract mentions the dopant atoms are on the surface and in the core of the CDs, but evidence for the location of these atoms does not seem to be present in the manuscript. Scheme 2 suggests they are just located on the surface.
4. Why is a pyrene-based model used for modeling of CDs computationally?
5. The emission plots should be plotted in a consistent order! (e.g. low excitation wavelength to high excitation wavelength).
6. In figure 4a, d, and e, there should be a check for the Raman solvent peak. These spectra have a significantly different shape, so this may be a possible reason for that.
7. Why is Rhodamine 6G used as a reference for quantum yield? This molecule absorbs and emits above 520 nm and is not suitable for the blue emitting CDs in this work. Quinine sulfate, the most common standard for CDs, would be a better choice.
8. Considering the typical error associated with quantum yield measurement for CDs, there is basically no difference between all the samples. This is not believable, since the intensities in the in the PL plots are very different (although concentration is not reported). The poor choice of reference standard may contribute to this similarity.
9. The AFM images in Figure 6c, d, and h show repeating shapes throughout the images suggesting that the tip may have been dirty when these measurements were acquired and may not be reliable.
10. AFM measurements are able to reliably show z-axis information for CDs, but because they are so small AFM does not measure x,y-axis information. TEM is needed for this, so the CDs cannot be declared as spherical from AFM alone.
11. The sharp XRD peaks look more crystalline than amorphous. The peaks at 27 degrees comes from a graphitic structure. It does not necessarily show evidence for the presence of boron as the authors state.
12. It would be good to integrate the XPS data to show the relative amounts of C, O, and B in the tested CDs.
13. What is the connection between sialic acid and boron? Why would CDs cross through this receptor?
14. For all CDs, is a passive diffusion believed to be the mechanism? Only the abovementioned pathway is suggested for boron, but the other element-doped CDs also enter into the cell.

Additional Questions:

Does the work significantly advance the understanding or development in this field?: No

Is this work of relevance to the chemistry community?: Yes

Are the conclusions of the work convincing and sufficiently supported by experimental evidence?: Yes

Is the experimental section sufficiently detailed to allow others to reproduce the work?: Yes

Are the reported claims adequately discussed in the context of the literature?: Yes

Are the number of tables and figures in the manuscript appropriate and clear?: Yes

Referee: 2

Recommendation: Major revisions

Comments:

This work presented the synthetic method influence of B, N, S, and P-doped carbon dots on HeLa tumor cells' toxicity. The authors conducted comparison experiments on the doped carbon dots with the following characterizations and HeLa tumor cell testing. However, the synthesis method and the doped carbon dots are not novel. The carbon dots HeLa tumor cell applications have already been reported too many times. The authors have not given any discussion or analysis to identify why the toxicity is different, for example: Why the B-CDs2 carbon dots showed significant precipitation on pH 3-4? What are the involved factors during different synthesis method result in the toxicity? Hence, I strongly recommend that the authors focus on the research question of the comprehensive evaluation and analysis of the method-induced toxicity by introducing more detailed evidence on the reason for the toxicity differences. The authors should explain the phenomenon rather than only present experimental results. Those issues have to be addressed before the publication.

Furthermore, some questions need to be noted:

1. The synthesis method of B, N, S, and P-doped carbon dots need to give references on previous reports.
2. In Fig 1, I would recommend to normalize the UV-vis curves.
3. In Fig 2, How to identify the exact band positions of CDs? The authors need to mention the molecular modelling details in the manuscript.
4. In Fig 6, the resolution of AFM can't support to identify the clear morphology. I suggest to conduct the TEM instead of AFM.
5. The success of doping on the carbon dots should be discussed associated with PL and FTIR.

Additional Questions:

Does the work significantly advance the understanding or development in this field?: Yes

Is this work of relevance to the chemistry community?: Yes

Are the conclusions of the work convincing and sufficiently supported by experimental evidence?: Yes

Is the experimental section sufficiently detailed to allow others to reproduce the work?: Yes

Are the reported claims adequately discussed in the context of the literature?: Yes

Are the number of tables and figures in the manuscript appropriate and clear?: Yes

FILES TO PROVIDE WITH YOUR REVISED MANUSCRIPT:

IMPORTANT: Your original files are available to you when you upload your revised manuscript. Please delete any redundant files before completing the submission. Please carefully check the spelling and format of all author names, affiliations and funding information. If your paper is accepted for publication, it is important this information is accurate to ensure your article is correctly indexed, which may affect citations and future funding evaluation.

- A point-by-point response to the comments made by the reviewer(s)
- Your revised manuscript with any changes clearly marked (.doc(x) or.pdf file)
- Your revised manuscript as a .doc(x) file including figures, without highlighting, track changes, etc. (If providing in TeX format instead, please also provide a final PDF version including figures). Please note that we cannot proceed with publication using a .pdf file only.

High quality figures

EITHER

embedded in a doc(x) file

OR

as numbered figures in separate files in .tif, or .eps format, with a resolution of 600 dpi or greater and structures preferably as ChemDraw files. Chemwindow files (.cwg/.cw2), ISIS/Draw exported in sketch format (.skc) and ChemSketch exported in ChemDraw format (.cdx) may also be supplied.

AND

- A table of contents entry: graphic maximum size 8 cm x 4 cm and one sentence of text, maximum 20 words, highlighting the novelty of the work
- Your revised Electronic Supplementary Information (if any)
- Your revised CheckCIF reports (if any). Please ensure that any revised cif files have been deposited with the Cambridge Crystallographic Data Centre (CCDC) via <https://deposit.ccdc.cam.ac.uk/> before you submit your revised manuscript.

For Feature Articles/Review-type articles only:

- A photograph and biography of yourself and your co-authors. Separate photographs of each author may be supplied or if you prefer, a group photograph, saved as a .tif, .pdf or .jpeg file. The resolution of the photographs should be 600 dpi or higher. The dimensions of the photograph in the printed journal will be 4 cm wide x 5 cm high (individual photograph) or 8.3 cm wide x 5 cm high (group photograph). Individual photographs should be accompanied by a maximum of 100 words; a group photograph by a maximum of 200 words. There can be a maximum of 6 individual biographies per article.
- Copies of permissions required from other publishers to reproduce figures. Please ensure that necessary permissions are acknowledged in the figure captions in accordance with the publishers' instruction. Information on how to obtain permissions and rights that we require are given on our website at <https://www.rsc.org/journals-books-databases/journal-authors-reviewers/licences-copyright-permissions/>

Dear Mr Fahmi:

TITLE: Comparison method effect on synthesize B, N, S, and P-doped carbon dots as dual high photoluminescence and selective to HeLa tumor cells

Thank you for transferring your manuscript to RSC Advances, published by the Royal Society of Chemistry. This is an automatic acknowledgement that you have uploaded your files to our online submission system. Your manuscript ID is: RA-ART-11-2020-009403

Your manuscript will be passed to an editor for initial assessment as soon as possible. If there are any problems with your submission we will contact you.

RSC Advances is a gold open access journal. If accepted, your manuscript will be published open access and the article will be subject to the appropriate article processing charge (APC). Discounted APCs and full APC waivers for corresponding authors in certain countries are available. All authors are given the option to apply for a waiver after signing the open access licence - please see the following URL for more details: <https://www.rsc.org/journals-books-databases/about-journals/rsc-advances>

Please note that RSC Advances now only publishes Paper and Review type articles. If your transferred submission is a Communication type article, this will be changed to a Paper type article if accepted for publication.

Please indicate the above manuscript ID when you contact us about this submission.

Do you have an ORCID iD? ORCID (Open Researcher and Contributor iD) is a unique researcher identifier that allows you to link your research output and other professional activities in a single record. We therefore encourage each researcher to sign up for their own ORCID account. Please edit your user account to link your ORCID iD or create a new one, ensuring that you have not linked your account to another researcher's ORCID iD. Please note that we are unable to do this on your behalf. If your article is accepted, you may choose to have your ORCID record updated automatically with details of the publication.

We already have the following information for authors of this manuscript: Wibrianto, Aswandi - No ORCID iD Available, Khairunisa, Siti - No ORCID iD Available, Sakti, Satya Candara - No ORCID iD Available, Nimah, Yatim - No ORCID iD Available, Purwanto, Bambang - No ORCID iD Available, Fahmi, Mochamad Zakki - <https://orcid.org/0000-0001-5430-9992>

This journal has a policy of sharing reviewer reports. Please note that the Editor's decision and copies of the reports will be shared with all reviewers who provide a recommendation on your manuscript.

Please contact us if we can be of any assistance.

Yours sincerely,

RSC Advances Editorial Office

06-Dec-2020

Dear Mr Fahmi:

Manuscript ID: RA-ART-11-2020-009403.R2

TITLE: Comparison method effect on synthesize B, N, S, and P-doped carbon dots with high photoluminescence property on HeLa tumor cells

Thank you for submitting your revised manuscript to RSC Advances. After considering the changes you have made, I am pleased to accept your manuscript for publication in its current form.

You will shortly receive a separate email from us requesting you to submit a licence to publish for your article, so that we can proceed with publication of your manuscript.

RSC Advances is a gold open access journal. Your manuscript will be published open access and the article will be subject to the appropriate article processing charge (APC). Discounted APCs and full APC waivers for corresponding authors in certain countries are available. All authors are given the option to apply for a waiver after signing the open access licence - please see the following URL for more details: <https://www.rsc.org/journals-books-databases/about-journals/rsc-advances>

We are offering all corresponding authors who are not already members of the Royal Society of Chemistry one year's Affiliate membership as part of their APC. If you would like to find out more please email membership@rsc.org, including the promo code OA100 in your message.

Learn all about our member benefits at <https://www.rsc.org/membership-and-community/join/#benefit>

We will email you information on how to access your RSC Advances article proofs shortly.

As an author you are entitled to a 25% discount on books published by the Royal Society of Chemistry. To receive this discount, enter the promotional code JLTH25 when purchasing from our online bookshop (pubs.rsc.org/bookshop). Please contact booksales@rsc.org if you have any problems.

Discover more Royal Society of Chemistry author services and benefits here:

<https://www.rsc.org/journals-books-databases/about-journals/benefits-of-publishing-with-us/>

Thank you for publishing with RSC Advances, a journal published by the Royal Society of Chemistry – connecting the world of science to advance chemical knowledge for a better future

With best wishes,

Dr Alexey M Glushenkov
Associate Editor, RSC Advances
