**ANTAGONISME *Pseudomonas diminuta* TERHADAP PERTUMBUHAN *Vibrio harveyi* DENGAN METODE KULTUR BERSAMA**

**Antagonism *Pseudomonas diminuta* On The Growth Of *Vibrio harveyi* With Mix Culture Method**

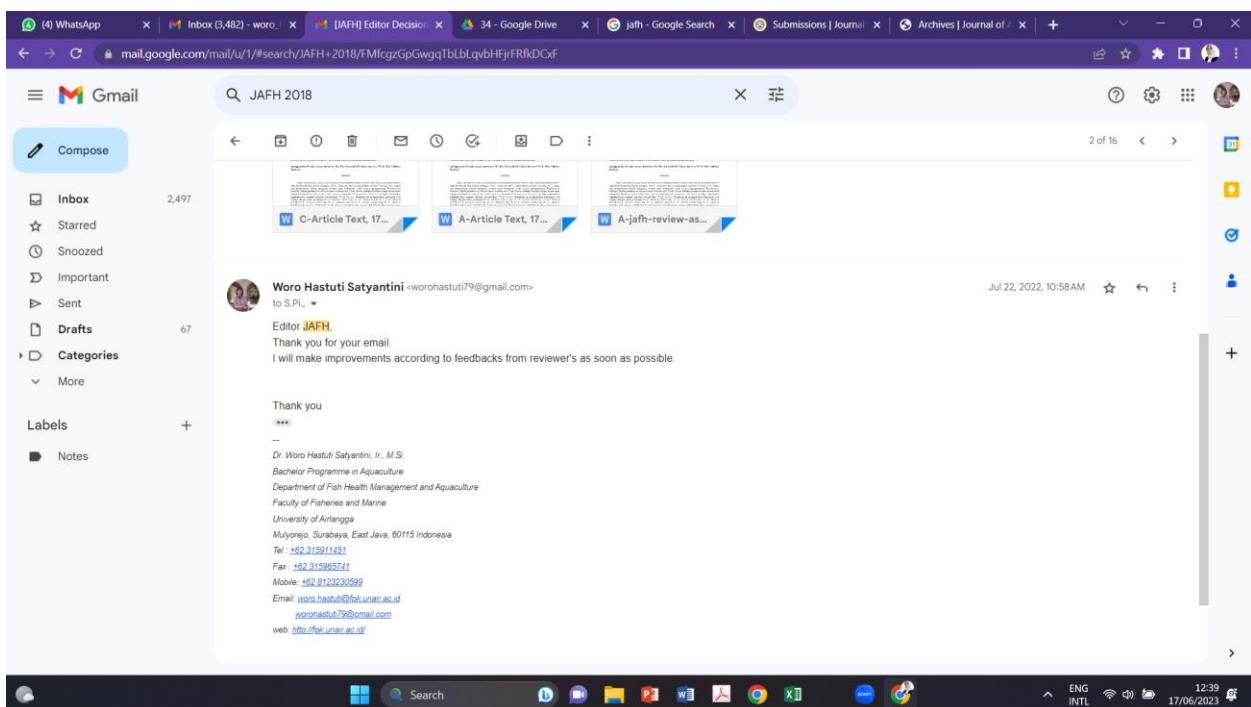

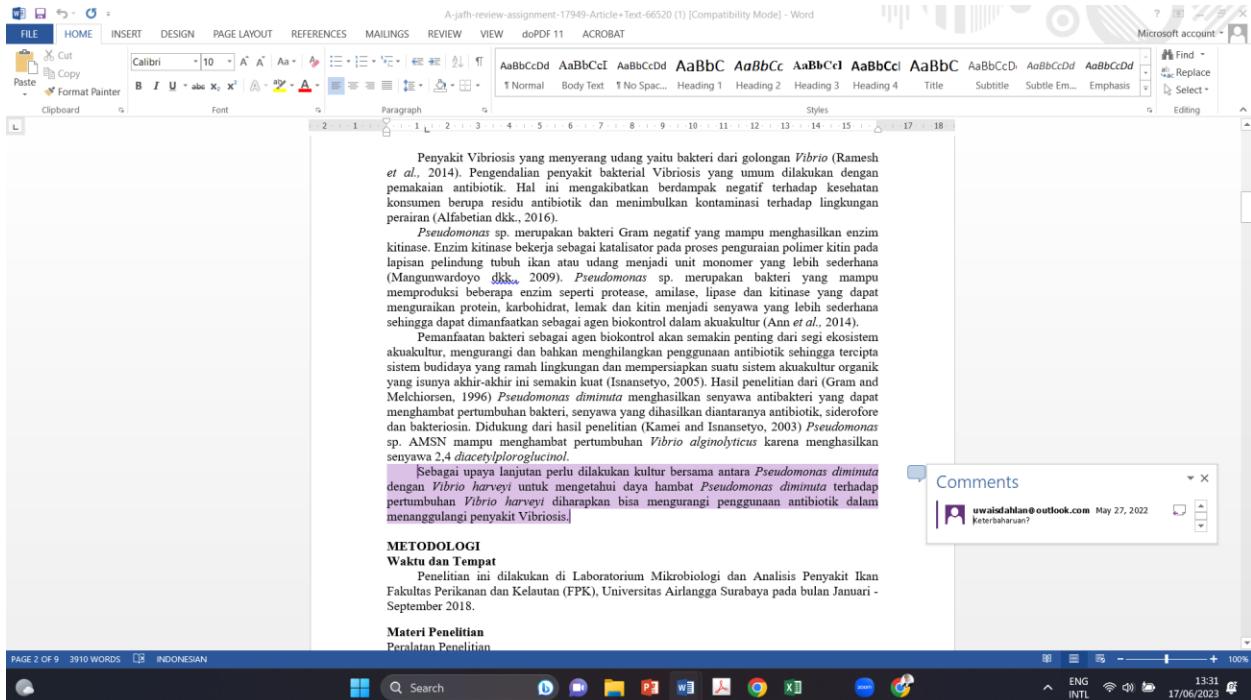

**Abstrak**

Salah satu kendala yang sering dihadapi dalam budidaya udang vaname yaitu adanya penyakit bakterial yang disebabkan oleh bakteri golongan *Vibrio*. Salah satu upaya pengendalian penyakit *Vibrosis* yaitu dengan cara pemerasan bakteri antagonis sebagai agen biokontrol, salah satunya menggunakan *Pseudomonas diminuta*. Dalam penelitian ini *Pseudomonas diminuta* dan *Vibrio harveyi* ditanam bersama dengan tujuan untuk mengetahui pengaruhnya terhadap pertumbuhan *Vibrio harveyi*. Penelitian ini menggunakan rancangan acak lengkap dengan enam perlakuan P0 (*P. diminuta* 10<sup>6</sup>CFU/ml), P1 (*V. harveyi* 10<sup>6</sup>CFU/ml), P2 (*P. diminuta* 10<sup>6</sup>CFU/ml+*V. harveyi* 10<sup>6</sup>CFU/ml), P3 (*P. diminuta* 10<sup>6</sup>CFU/ml+*V. harveyi* 10<sup>5</sup>CFU/ml), P4 (*P. diminuta* 10<sup>6</sup>CFU/ml+*V. harveyi* 10<sup>4</sup>CFU/ml), P5 (*P. diminuta* 10<sup>6</sup>CFU/ml+*V. harveyi* 10<sup>3</sup>CFU/ml). Hasil penelitian ini menunjukkan pada P2, P3, P4 dan P5 mengalami penurunan pertumbuhan *V. harveyi* jika dibandingkan dengan P1 (kontrol). Penurunan pertumbuhan *V. harveyi* terjadi pada jam ke-8 sampai jam ke-48. Perlakuan P3 (6,45x10<sup>6</sup>CFU/ml), P4 (5,28x10<sup>6</sup>CFU/ml) dan P5 (5,15x10<sup>6</sup>CFU/ml) pada jam ke-16 inkubasi berbeda nyata penerapan dengan perlakuan P1 (6,45x10<sup>6</sup>CFU/ml). Berdasarkan hasil uji coba menunjukkan bahwa P2, P3, P4 dan P5 berbeda nyata ( $P<0,05$ ) dengan P1. Dari penelitian ini disimpulkan bahwa peningkatan *Pseudomonas diminuta* kepadatan 10<sup>6</sup>CFU/ml dapat memperlambat pertumbuhan *V. harveyi*. Penurunan pertumbuhan *V. harveyi* paling besar terjadi pada jam ke-16.

Kata kunci: Kultur Bersama; *Vibrio harveyi*; *Pseudomonas diminuta*; Antagonism.

**Abstract**

One obstacle that is often faced by vanname shrimp farming is bacterial disease caused by *Vibrio* bacteria. One of the efforts to control *Vibiosis* is by using antagonist bacteria as a biocontrol agent, one of which uses *Pseudomonas diminuta*. In this study, *Pseudomonas diminuta* and *Vibrio harveyi* were cultured together with the aim of finding out the optimal density and effective incubation time of *Pseudomonas diminuta* which can provide the highest inhibition to the growth of *Vibrio harveyi*. This research method uses a complete randomized design with six treatments P0 (*P. diminuta* 10<sup>6</sup>CFU/ml), P1 (*V. harveyi* 10<sup>6</sup>CFU/ml), P2 (*P. diminuta* 10<sup>6</sup>CFU/ml+*V. harveyi* 10<sup>6</sup>CFU/ml), P3 (*P. diminuta* 10<sup>6</sup>CFU/ml+*V. harveyi* 10<sup>5</sup>CFU/ml), P4 (*P. diminuta* 10<sup>6</sup>CFU/ml+*V. harveyi* 10<sup>4</sup>CFU/ml), P5 (*P. diminuta* 10<sup>6</sup>CFU/ml+*V. harveyi* 10<sup>3</sup>CFU/ml). The results
