

ABSTRACT

Transitional in the function role of central government from centralization into be centralized to the regional autonomy will give an impact to the health service of Planning Family program, among other things the servicing system to the usage of contraceptive device mix in national, regional and local. Although Planning Family Implant contraceptive device forms a contraceptive device who are reversible, effective, efficacy, safety and acceptability in comparison with the other hormonal contraceptive device in this matter's very low its absorption.

Another interferes namely the donor state aid decreasingly, ability to pay it's still low but willingness to pay it's very high and KAP (knowledge, attitude, practice) from provider, midwife, doctor, and private practice are still average of low.

This experiment to make the training model of marketing, installation, extraction to the Planning Family Implant contraceptive device with the experiment methodology to pay attention who make use of "Post test control group desain", intends to increase KAP's transitional to provider, to increase the trained staff quality, to increase the amount of scope and client's satisfaction. The experiment method's required in two phases, namely Model building and Model testing. With conclusion that the experiment result of the training model such as the above mentioned fully it's not successful yet, but in said training able to increase knowledge, nevertheless unable to increase attitude, provider practice and scope, and client's satisfaction.

From this experiment result's recommended in order to the training model's necessary completed and more tested, the experiment's enforced to a bigger sample and the experiment design its ideal to make use of pre and posttest.

Keywords: Training Model, Providers, Knowledge-Attitude, Practice, Client's satisfaction.
