Suyanto, M.Si, Departemen Kimia, Fakultas Sains dan Teknologi, Universitas Airlangga, Surabaya

ABSTRAK

Metode yang sederhana dan selektif untuk memisahkan kloramfenikol telah dikembangkan menggunakan *molecularly imprinted polymer* (MIP) sebagai adsorben. MIP disintesis menggunakan kloramfenikol sebagai *template*, asam metakrilat (MAA) sebagai monomer dan kloroform sebagai porogen secara polimerisasi bulk. MIP dikarakterisasi menggunakan *fourier transform infrared spectroscopy* (FT-IR), *scanning electron microscopy* (SEM) dan adsorpsi-desorpsi N₂. Adsorpsi dilakukan dalam sistem *batch* menggunakan variasi waktu, pH dan suhu. Analit yang teradsorpsi ditentukan secara tidak langsung dengan cara menganalisis analit yang tidak teradsorp menggunakan *high performance liquid chromatography* (HPLC) dengan detektor UV-VIS pada panjang gelombang 273 nm. Parameter adsorpsi yang ditentukan antara lain kinetika, isoterm dan termodinamika adsorpsi. Adsorpsi kloramfenikol pada MIP mengikuti kinetika orde satu dengan koefisien korelasi (R²) sebesar 0,9674. Model isoterm mengikuti model Freundlich dengan R² 0,9356, K_F = 1,9810 mg/g (L/mg)^{1/n} dan n = 0,5547. Nilai ΔH°, ΔS°, dan ΔG° berturut-turut adalah -6,1412 kJ/mol, -0,0067 kJ/mol dan -4,0921 kJ/mol. Kapasitas adsorpsi yang diperoleh hingga 4,0828 mg/g dan faktor *imprinting* sebesar 5,1810.

Kata Kunci: Kloramfenikol, *molecularly imprinted polymer*, adsorpsi, kinetika, adsorpsi isoterm, termodinamika

Chrisnandari, R.D., 2015, Chloramphenicol Adsorption Using Sorbent Based on Molecularly Imprinted Polymer in Batch System, The thesis under the guidance of Dr.rer.nat Ganden Supriyanto, M.Sc and Dr. Ir. Suyanto, M.Si, Departement of Chemistry, Faculty of Science and Technology, Airlangga University, Surabaya

ABSTRACT

A simple dan selective method for extraction of chloramphenicol was successfully developed using molecularly imprinted polymer (MIP) as sorbent. MIP was synthesized using chloramphenicol as template, methacrylic acid (MAA) as monomer and chloroform as porogen by bulking polymerisation. MIP were characterized by fourier transform infrared spectroscopy (FT-IR), scanning electron microscopy (SEM) and N₂ adsorpstion. Adsorption taken place in batch system with variation in contact time, pH and temperature. The adsorpted analyte was determined indirectly by analysis of analyte which still remain in aqueous solution using high performance liquid chromatography (HPLC) with UV-Vis detector at wavelength 273 nm. Adsorption parameters such as kinetics, isotherm and thermodynamics were determined. Adsorpstion chloramphenicol on MIP follow kinetics first order with correlation coefficient (R^2) 0,9674. The isoterm adsorption was follow Freundlich model with R^2 0,9356, $K_F = 1,9810 \text{ mg/g}$ ($\text{L/mg}^{1/n}$) and $n = 0,5547$. The value of ΔH° , ΔS° , dan ΔG° are -6,1412 kJ/mol, -0,0067 kJ/mol.K and -4,0921 kJ/mol respectively. Adsorption capacity obtained is up to 4,0828 mg/g and imprinting factor value is 5,1810.

Key Words: *Chloramphenicol, molecularly imprinted polymer, adsorption, kinetics, isotherm adsorption, thermodynamics*
