## ABSTRACT

Acne is one of a health problem and can be treated by self medication. Acne is perceived by teenagers as a problem about health, problem about appearance and one of signals at puberty. The perceptions of acne can influence the action to be taken by medication.

The correlation of acne perception with the right self medication of junior high school students in Mojokerto has been investigated. The study was performed with survey method, and the respondents being clustered based on gender and school location.

By using *chi square* analysis, the data showed that there was correlation between acne perception and the right self medication. The acne perception as a health problem was treated appropriately i.e using medication. The acne perception as appearance problem, the treatment was right, i.e cleansing the face, while the acne perception as one of puberty signs, they were not treated.

In the acne perception as a health problem, the choosing of the medication has not yet right, so that the role of pharmacist was needed to give information and education about the acne and its medication.
