5. Title of Manuscript

Study of Diabetic Mellitus and Knowledge of Lotion Foot Care on The Community

6. Abstract

The prevention of Diabetic Mellitus (DM) and its complications is the main aim of this study, in addition to the training of lotion foot care application and the development of small scale industry. The research team delivered knowledge in the form of training on Diabetic Mellitus, healthy food, treatment and prevention of complications, and small-scale production of cosmetic products. The aim of this study was to determine the correlation between training on diabetic and lotion foot care application as preventive measures against diabetic complications on the patient's blood glucose levels in the community of residents in Banyuwangi, Surabaya. It was expected from this training that the knowledge of the residents increases and people living with diabetic undergo lifestyle changes and therefore blood sugar levels can be controlled. The parameters measured in this research were blood glucose levels, the antidiabetic drug types consumed, and compliance on diabetics. This study used the data taken from 60 patients with DM over a period of one month. Questionnaires and log books were used to retrieve data and changes in blood glucose levels in diabetic patients. The results showed the demographic data of patients with type 2 diabetic of 85% female and 15% male, with the range of patients aged of 61-70 years of 46.67% and had history of diabetic (90%). The history of drugs consumed by respondents was antidiabetic drugs such as metformin (40%), glimepiride (33.37%) and insulin (6.67%). In addition, the increased knowledge of DM patients after being given the training compared to before training was shown in several questions in the questionnaire. A statistical analysis using t-test analyzed a correlation between training provided in order to enhance understanding of the patient, as well as correlation with blood glucose levels. A paired T-test showed that there was a

relationship between the knowledge of trainees before and after training ($p < 0.05$). An interesting result was that there was no relationship between blood glucose levels before and after training provided ($p > 0.05$).

7. Keywords (2-10)

Diabetic Mellitus, Antidiabetic Drugs, Lotion Foot Care, Blood Glucose Level

Dear Editor,

We would like to know the progress of our manuscript that we submitted last 25th January 2018 whether it needs further revision or accepted?

Looking forward to your positive response.

Kind Regards,
Dewi Melani Hariyadi, PhD, Apt.

Dear author

Your manuscript number " 04222018PQAD " bearing with title "

Study of Diabetic Mellitus and Knowledge of Lotion Foot Care on The Community

" has been provisionally accepted after minor modifications. It may be published in the upcoming issue of the journal subject to deposition of Open Access Fee USD150

The authors are required to use the **paypal link** available at this link www.ijpqa.com/fee. Other modes are not acceptable.

Note: The authors may **reply this mail** with modified manuscript containing minor typography errors if left coincidentally during submission. The errors must be highlighted clearly in **red color font**. The modifications are subject to approval of editorial board. Any typological/coincidental error left after this stage will not be considered. In case the modifications are not minor, then authors may be asked to withdraw and resubmit manuscript.

Important: After making a transaction, please confirm transaction by providing transaction details as a reply to this mail only.
