

ABSTRACT**CORELLATION BETWEEN WORK LOAD, WORK STRESS ON THE PERFORMANCE OF WULAN'S HOMECARE IN SURABAYA**

Corelational Study

By : Desy Igacarryna

Introduction: nursing service in homecare is synthesis of nursing health community andncertain technical skill that come from certain nursing specialization. Stress can appear if people have difficult task or responsibility and that people can not finished their task, that can cause body to experience stress. The purpose of this study is to investigate correlation between work load, stress that caused by work with performance of nurse who work in Wulan Surabaya homecare. **Method:** the design of this study was correlational with cross sectional approach. The population of this study were all of nurse who work in Wulan Surabaya homecare or 50 people. Data were collected using work load quissionaire, stress caused by work quissionaire, nurse's performance quissionaire. Data were analyzed using spearman's rho with sigmificance level of $p < 0,05$. **Result:** this study showed that there was a strong positive correlation between work load with nurse's performance ($p=0,00$ $r=0,767$), and there was a strong positive correlation between stress caused by work with nurse's performance ($p=0,00$ $r=0,811$). **Discussion:** there is meaningful positive correlation between independent variables (work load, stress caused by work) with dependent variable (nurse's performance). Future Study was expected to improve nurse performance of work load with other reaserch design or with qualitative method.

Keyword: work load, stress caused by work, nurse's performance, homecare
